In the course of gathering information about the improvement of the Appalachian Thruway through Central Pennsylvania and its resulting impact on adjacent counties and communities, TRIP talked with a number of representatives of local industries who attested to the strong drawing power of good highways.

Hoss' Restaurants has more than two dozen locations in Western and Central Pennsylvania, including a new restaurant at the intersection of Route 220 and the Pennsylvania Turnpike. Todd Robinson, Safety Insurance and Government Affairs Director for Campbell Enterprises which owns Hoss', explains that the new location of the upgraded Route 220 was instrumental in making the final decision of where to locate their newest restaurant.

"People used to have to travel all the way to Breezewood to get to the pike," Robinson said. "Now with the new road, people can get onto the turnpike directly at Bedford."

Robinson explained that Campbell Enterprises had bought an older motel that "was not in the greatest of locations" so was suffering a slump in both hotel and restaurant business. However, because of the improved access via Bedford, the new Hoss' Restaurant is expected to attract a significant increase in business.

In addition to the restaurant, Campbell Enterprises also has acquired the food distribution company that supplies all Hoss' Restaurants, called Hoss' Fresh Express. The Fresh Express operation recently bought a new warehouse on Route 220 where all butchering and other food preparation will take place. Because this warehouse is serviced exclusively by truck, the improved highway will play a major part in facilitating day-to-day operations, especially in easing access for shipments to and from the Pittsburgh area.

"We anticipate being able to get more products in and out of the warehouse more quickly," said Robinson.

Jim Estep is a real estate developer and head of a local roads group in the Altoona area. Estep believes "highways are the key," that economic development in the area is very dependent on its access to I-80 and the Pennsylvania Turnpike.

"That access is important both to industrial development and to tourism, which is a major source of revenue in Pennsylvania," according to Estep. The state's universities also rely on good roads, since they draw thousands of fans to football and basketball games and other sporting events every year.

Estep recalled that in both business and personal travel to the Delaware and Maryland shores, he used to have to rely on Route 22, which he describes as "deplorable, slow and unsafe." Now he is able to reach the Turnpike quickly and safely, thereby reducing both the duration and aggravation of his journey.

Estep also has worked in both trucking and towing, and has seen how bad roads can destroy expensive vehicles. He believes that truckers are willing to pay for safer, more efficient roads, rather than taking their chances on bad roads.

Harry Robinson, Vice President and General Manager at Raible's Commercial Warehouse in the Altoona area, believes the new Route 220 will save both time and money for his company. But, more importantly, Robinson believes it will have a major impact on the entire trucking industry. Improving this connector from the northern part of the state down to the turnpike will reduce both time and costs for truckers, he said.

Prior to the new Route 220, trucks had to rely on circuitous and congested routes, including Route 22 through the mountains. Robinson estimates the additional time and motor fuel required for the mountainous route cost the average trucker about $15 an hour.

"There are 37 common carriers servicing the Altoona area," he said, "and just imagine how the new Route 220 will affect them." Robinson estimates that truck traffic in the region probably will increase significantly in the next few years.

"It is much cheaper to run a truck down a four-lane highway with no stopping and starting than being held up in the mountains or going through the center of town with its stoplights and traffic," Robinson said. "Driver satisfaction also is very important to trucking companies. Driving a smoother, wider expressway is less tiring and tedious, reduces stress levels and contributes to an improved margin of safety."

International Barrier, a highway barrier producer headquartered in Toronto, has located its first manufacturing facility a mile away from the Route 220 interchange near Claysburg. The company currently is hiring 25 new employees and plans to add another 50 employees over the next two years. At least 50 percent of the steel and other raw materials used in their product come by truck, and within the next couple of years, the company plans to ship all products destined for the Northeast on the new Route 220.

Steve Pridmore, Vice President of Finances at International Barrier, believes that "being located near an accessible highway is a huge marketing advantage in a very competitive business." He explained that customers generally visit the plant to see the products and individual states must be sold separately. Consequently, the plant receives numerous visitors. "Route 220 will save us time and money, and shipping costs will be dramatically reduced," Pridmore said.

Stephen Zamias is Vice President of Finance at George D. Zamias Developer in Johnstown, a real estate developer who believes "transportation is directly important to my business." At the end of the year, Zamias will begin work on a mall adjacent to Route 220, a site picked specifically because of the new road.

"Without 220, another mall would not have been built in this area," Zamias said. "Altoona is nestled in the mountains, and you can't get businesses to relocate without a good highway system. One of the big department stores locating in the new mall is doing so because of the new highway."

Zamias credits Congressman Shuster for having the insight to realize how important a good road network is in terms of breeding new activity. "Route 220 enables people throughout the corridor to travel where they want to in a short time. Just as crucial is the transport of goods and raw materials necessary to stimulate growth in the area," he said.

Zamias expects travelers from as far away as Lewistown, State College and Huntingdon now that most of the improved road is open. "You need a good road network to do good business. When the road is completed all the way to I-80, I believe Altoona will rebound even more strongly."

Good Roads Help Tourism

Good roads are important to tourism too. For example, Old Bedford Village, a reconstructed 19th century historic pioneer settlement north of Bedford, is welcoming more visitors because of the improved access offered by the highway improvements.

Robert Sweet, former Bedford County Commissioner and current chairman and president of the board of Old Bedford Village, believes Route 220 will have a major impact on tourism, opening up direct routes both to the south (Washington, D.C. and Baltimore) as well as to the North (New York and New England).

"Highways are vital to economic development," Sweet said. "Transportation is the secret to industry and tourism and without it, neither one will thrive."

He added that, in 1975, the county unemployment rate was 22.8%; this year, the rate has dropped to 6.5%.

"A good transportation system is especially important to rural areas," said Sweet. "People don't want to waste the time and money traveling bad roads to get to an event. In order to be competitive, we need to draw tourists from places like Baltimore and Washington, and they won't come if it takes too long."

Sweet believes Central Pennsylvania is well on its way to becoming an East Coast attraction. Bedford is being considered as the summer home for the Pittsburgh Symphony and the city is redeveloping the Bedford Springs Festival for the Performing Arts (special events, films, chamber music).

"Good roads provide an economic boost to tourism and industrial development," agrees Roger Nave, a member of the Bedford Development Council and also involved in local real estate and fast food operations.

Nave said Route 220 has already had an impact on traffic in the area: "The increase in traffic has brought more customers and more pass-through traffic, generating business as people decide to stop, shop and eat."

In addition, Nave said, as an industrial base grows, residential housing gets a real shot in the arm. "As roads improve, the whole corridor is more attractive to businesses and industry.

"More people move into the area, and more people can afford to buy property or a house or to upgrade to a larger home. There is no doubt that the economic impact will trickle through the entire county and everyone will benefit."

One of Pennsylvania's newest historical preservation and tourism innovations is "America's Industrial Heritage Project," established in 1986 as part of a National Park Service pilot project. The Heritage Project is attempting to preserve, connect and publicize the historic landmarks of a nine-county area of South Central Pennsylvania noted for its rich background in natural resources.

The Project includes such places as the Johnstown Flood Museum, the Altoona Railroad Museum, the Cambria Iron Company, Wharton Furnace, the Bedford and Schellsburg Historic Districts, as well as a number of state, county and federal parks. Randy Cooly, project director, reports increasing numbers of visitors to the park because of improved transportation. Last year, for instance, during the centennial festivities commemorating the Johnstown flood, some 120,000 people visited the museum. This past summer, 85,000 people visited each month.

"There is a direct link between good roads, tourism and economic development," Cooly said. He believes the greatest accomplishment of the expanded Route 220 is that it makes Altoona and the Historic Project a convenient drive from the expanding Washington/Baltimore market, generating a sense of proximity -- more "do-able" as an excursion. In fact, Cooly pointed out, the Altoona-Johnstown area is within one day's drive of two-thirds of the nation's population.

"When Route 220 is completed to the north, creating a very effective connection to the New York City area (via I-80), the impact will be even more profound," Cooly said.

Improved Safety on 220

The new Route 220 is smoother, wider and more convenient for motorists, but those are not the only improved design features of the new highway. A number of modern safety features have been built into the design, creating a safer roadway and expanding the margin of safety for drivers.

These improvements include such features as longer decision sight distances, smooth speed transition design for acceleration and deceleration lanes and simultaneous horizontal and vertical curves.

In fact, the fatality rate on new sections of Route 220 already has been cut by 50 percent, and state officials anticipate it will drop another 50 percent when the entire stretch -- from the Turnpike to I-80 -- is completed. Prior to improvements, an average of 6.2 traffic fatalities occurred annually on old Route 220. This year, that average had dropped to four fatalities, and it is expected to be cut in half (to two fatalities annually) when the road is finished.

In addition, officials have tracked traffic injuries on both sections of Route 220 for the past five years and found that injuries occur nearly four times more frequently on the old section. A total of 946 injuries were reported on old Route 220 and 256 injuries were reported on new Route 220 since 1984.

38-258 O--91——91

These fatal and injury accident reductions make sense in light of recent research conducted by the Transportation Research Board. In "The Relationship Between Safety and Key Highway Features," researchers found that widening of roads can reduce single-vehicle accidents by as much as 55 percent and head-on accidents by as much as 51 percent.

Also, widening a road by just one foot can reduce "run-off-the-road" and "opposite direction" accidents by 10 percent, while two feet of widening can reduce these types of accidents by up to 23 percent.

The Need for Improvements on Other Roads

This study has focused on the demographic, economic and safety impacts of Route 220 on Central Pennsylvania, specifically, Blair and Bedford Counties. But there are other areas of Pennsylvania where roads are groaning under overwhelming traffic volumes, where new lanes, wider lanes and safety improvements are needed to accommodate growth.

The Pennsylvania Department of Transportation (PennDOT) has included some of the needs in their 12-year program through the year 2000. A total of 196 miles are scheduled to be widened through the addition of lanes (excluding intersection improvements) at a cost of $494.6 million. Another 332 miles will be realigned or relocated at a cost of $3.8 billion.

Included in these 332 miles are 148 miles of turnpike projects to be completed by the Pennsylvania Turnpike Commission for some $2.5 billion. These projects include sections of the Beaver Valley Expressway in Western Pennsylvania, the Greensburg Bypass in Westmoreland County, Route 219 from the Ebensburg area to I-80 and the Mon-Fayette Expressway from the West Virginia state line to Pittsburgh.

The 528 miles of major improvements, to cost $4.3 billion (based on PennDOT's 12-year plan), certainly will contribute to the mobility and economic health of the areas. However, 528 miles represent about 1.3 percent of the 41,445-mile state-maintained highway system, and less than 2 percent of the state's 26,444-mile "Federal-aid" highway system.

Inadequate Federal-Aid Roads

Pennsylvania's federal-aid highways include the most heavily traveled roads under state and local jurisdictions. These roads are eligible for federal funds for construction and rehabilitation.

Pennsylvania's federal-aid system makes up just 22.8 percent of the total 115,900 miles in the state, but it carries 83.8 percent of total traffic.

The system includes Pennsylvania's 1,523-mile Interstate system, which carries about a sixth of all traffic. The rest of Pennsylvania's federal-aid system -- 24,921 miles of primary, secondary and urban roads -- carries more than two-thirds (67.1 percent) of all traffic.

The following chart shows these inverse proportions.

Pennsylvania's Roads*

Designation	Number of Miles	Traffic Volume
Federal Aid:		
Interstate	1,523 miles (1.3%)	13.158 bil. (16.7%)
Primary	9,963 miles (8.6%)	34.056 bil. (43.4%)
Secondary	7,962 miles (6.9%)	13.213 bil. (16.8%)
Urban	6,996 miles (6.0%)	5.446 bil. (6.9%)
Subtotal	26,444 miles (22.8%)	65.873 bil. (83.8%)
Non Fed. Aid	89,464 miles (77.2%)	12.753 bil. (16.2%)
TOTAL	115,908 miles (100.0%)	78.626 bil. (100.0%)

* Source: Highway Statistics 1987, Federal Highway Administration

Federal data on Pennsylvania's federal-aid highways show that only a small proportion of the system is comprised of four-lane highways divided by a median strip, despite the fact that federal-aid highways carry most of the traffic.

Just 12.8 percent -- 3,378 miles -- of the system is made up of four or more lanes of divided highways, including 1,523 miles of Interstate highways. Another 8.5 percent -- 2,240 miles -- are four-lane undivided, three-lane or one-way roads.

The vast majority of Pennsylvania's most heavily traveled roads, though -- 20,826 miles, or 78.7 percent -- are two-lane streets and highways. The following chart categorizes the kinds of roads on Pennsylvania's federal-aid system:

(miles)

Fed.-Aid Designation	4-lane or more Divided	4-lane undivided 3-lane/1-way Streets	2-lane	TOTAL
Interstate	1,523	--	--	1,523
Primary	1,598	929	7,436	9,963
Secondary	13	612	7,337	7,962
Urban	244	699	6,053	6,996
	3,378 (12.8%)	2,240 (8.5%)	20,826 (78.7%)	26,444 (100.0%)

By comparison, in New York, 16.8 percent (4,191 miles) of the federal-aid system is four or more lanes and divided; in Ohio, 13.3 percent (3,663 miles) is four or more lanes and divided.

TRIP Recommendations

The impact of the new Route 220 improvements to the Central Pennsylvania region is dramatic proof that transportation improvements foster healthy economic growth. However, due to budget constraints, many areas of the state continue to suffer from inadequate highways that are forced to carry growing traffic volumes.

The state's current 12-year program attempts to address the problem, but only 528 miles of improvements (at a cost of $4.3 billion) are planned to accommodate traffic growth and to support economic expansion in all areas of the state.

However, traffic continues to increase on Pennsylvania's roads. Since 1980, total traffic in the state has increased by 11.4 percent, or more than eight billion vehicle miles a year, from 71.52 billion in 1980 to an estimated 79.64 billion in 1988. That's an extra 70,000 vehicle miles a year on each mile of Pennsylvania's total road system.

Pennsylvania needs to invest in its most heavily traveled roads now. Delaying improvements will only increase costs. For instance, TRIP has found that road surfaces in "fair" condition can be resurfaced for a quarter of the cost of reconstruction.

Inflation, too, takes its toll on rehabilitation efforts. While the national federal-aid highway construction index, published by the Federal Highway Administration, increased 19.2 percent (from 155.0 to 184.7) between 1984 and 1988, Pennsylvania's federal-aid construction index jumped 51.5 percent (from 146.2 to 221.5) in the same time.

TRIP recommends that Pennsylvania implement the Route 220 concept statewide by constructing an "economic generator highway system" that would include the widening and improvement of many of the state's two-lane primary highways.

The primary highway system, which does not include the Interstate highway system, makes up 8.6 percent of the mileage in Pennsylvania, but carries 43.4 percent of all traffic. Just five years earlier, the primary system made up 8.6 percent of all mileage but carried just 37.1 percent of the traffic. Traffic volumes on this important system are increasing faster than the system can be expanded and improved to accommodate the growth.

Conclusion

The improvements to Route 220 through South Central Pennsylvania clearly have had a substantial positive economic impact on the adjacent communities and counties. TRIP's research shows that 52 companies have settled or expanded operations in Blair County alone, generating more than 2,500 jobs for area residents.

More than 1,000 new jobs have been created by business expansions in Bedford County. Retail sales in the Altoona metropolitan area alone jumped by more than $57 million annually in five years.

But there are many areas of Pennsylvania where traffic-laden, two-lane primary roads trek through growing towns or wind through rural sections, connecting farms with markets, or cities with towns and villages.

In fact, more than three-fourths of Pennsylvania's federal-aid primary road system is comprised of two-lane roads. This is the system that carries 43.3 percent of all traffic in the state -- more than 93 million vehicle miles a day.

TRIP's recommendation that Pennsylvania expand and improve its primary system will help boost other local economies just as the 220 improvements have done in Blair and Bedford Counties. If the state hopes to remain competitive, and to provide mobility for its businesses, industries and private citizens, these improvements must be made. To delay such action will only increase the cost of improvements, exacerbate growing traffic congestion and traffic safety and encourage a continuing decline in quality of life for Pennsylvania's citizens.

TESTIMONY
OF
PETER LAPOINTE
ON BEHALF OF
HAULERS AGAINST LONGER TRUCKS

REAUTHORIZATION OF FEDERAL AID HIGHWAY ACT
FIELD HEARING

SUBCOMMITTEE ON SURFACE TRANSPORTATION
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
U.S. HOUSE OF REPRESENTATIVES

ALTOONA, PENNSYLVANIA
SEPTEMBER 17, 1990

Good morning, Mr. Chairman. I appreciate this opportunity to appear before the subcommittee.

My name is Peter LaPointe. I am vice president of Eastern America Transport and Warehousing which is headquartered in Philadelphia and operates facilities and delivers goods along the East Coast from Maine to Virginia.

Among its motor carrier services, Eastern provides transportation for trailers and containers having a prior or subsequent move by either rail or steam ship. This aspect of the transportation business is known as intermodalism.

I appear before the subcommittee today in behalf of H.A.L.T. - Haulers Against Longer Trucks. HALT is a nationwide coalition of motor carriers who rely substantially, and in many cases exclusively, on transporting trailers and containers involved in intermodal service for their livelihood.

Mostly, these firms are small, family owned and operated businesses. They are concerned that the enactment of any law increasing federal maximum truck weight limits above the current 80,000 pounds would foster the widespread use of longer combination vehicles (LCVs) on our nation's highways. Use of such vehicles would put most, if not all, of these entrepreneurs out of business.

In lieu of legislation which would relax our weight laws and sanction the use of twin 48-foot trailers and triple 28-foot

combinations, intermodal truck operators urge the Congress to enact a bill which fosters the growth and expansion of intermodalism.

Mr. Chairman, intermodal trucking achieved great success during the 1980s riding the wave of extraordinary growth in this industry. Intermodal trailer and container movements grew from three million loads in 1980 to more than six million by the end of the decade. However, while this growth is impressive, the competitive environment (vs. trucks) in our industry resulted in this business producing only marginal profits for the railroad industry.

Much of the business railroads handle in domestic intermodal service is extremely susceptible to truck diversion. Consequently, any Congressional action allowing the trucking industry the right to use longer combination vehicles as a consequence of higher fuel taxes would have a devastating economic impact on rail intermodal -- and by extension on this segment of the trucking business.

Studies by the railroad industry estimate that just the initial impact of twin-48 foot trailers would mean a loss of 9 per cent of all rail ton-miles and 52 per cent of net operating revenues, based on 1986 figures, the most recent available.

Intermodal is hurt far worse than the average: railroads would lose 23 per cent of intermodal traffic and 27 per cent of intermodal gross revenues if twin 48s were legalized.

The long-term impact of the lost net revenue would be even greater intermodal diversion. Rail intermodal is dependent on expensive fixed facilities. With the loss of over a quarter of intermodal revenues, many of these facilities no longer would be economically viable.

According to several senior rail marketing officials, if railroads lose this much intermodal traffic, they would shut down their intermodal operations.

Work by Paul Roberts, a prominent independent transportation economist, also confirms the disastrous impact of legalizing twin 48s. According to Dr. Roberts, even the intermodal industry's new and highly successful doublestack business would not be immune from the effects of the broader use of these vehicles.

The impacts of triple 28 combinations is harder to estimate. But triple 28s would also divert substantial volumes of rail traffic. Railroads almost certainly would lose much, if not all, of the small package and LTL line-haul traffic they have won in the last few years.

Major small package trucking lines like UPS, Roadway Express, and Yellow Freight, who in recent years have increased their purchased transportation (almost all of it rail intermodal) likely would shift much of their line-haul back to the highway. So, the losses and lost potential for rail intermodal would be substantial.

Mr. Chairman, given this likely economic scenario should our weight laws be relaxed and LCVs gain a broader foothold, we in the intermodal trucking industry are hard-pressed to see how the tearing down of one of transportation's success stories of the 80s makes sense.

While I have explained how the effects of sanctioning the use of LCVs would affect the intermodal business on a macro level, I want to take a few moments to focus on the economic and personal upheaval the use of LCVs would cause the trucking entrepreneurs I alluded to earlier.

Intermodal truck operators have close ties to the communities

in which they operate. They employ neighbors and friends and provide a vital transportation service. If you think about it, virtually every intermodal trailer and container that moves in this country, at some point in its journey, moves over the highway. Intermodal truckers, or draymen, as they are sometimes called, handle this crucial activity.

Any substantial change in the intermodal market brought about by diversion of freight to lower cost operators of LCVs likely would see these small firms fail. Ironically, the beneficiaries of lower cost LCV operations would be what we call "absentee truck lines" - those large regional and national carriers who pass through the communities where the intermodal truckers operate, but who make no contribution to the community.

The loser, meanwhile, is the locally-domiciled intermodal trucking firm who employs local people, contributes to the community's economic growth, and provides much needed revenues to its tax base.

We believe that as the subcommittee proceeds with this legislation, it should evaluate the economic ramifications of its work on all levels.

In a broader context, Mr. Chairman, we share the widespread concern of many Americans about our continued reliance on foreign oil and the ongoing deterioration of our environment and infrastructure. Given these vexing problems, HALT does not believe it is prudent public policy to undermine the continued growth of intermodalism by sanctioning use of LCVs.

Intermodal transportation involves the best combination of the nation' surface transportation resources --the economy and efficiency of long haul rail and the flexibility short haul truck.

And it does it all on less energy and while reducing highway congestion and air pollution.

In its deliberations on this vital issue, we would urge the subcommittee to carefully evaluate how best to invest our limited financial resources in meeting the nation's transportation requirements into the 21st century.

Intermodalism certainly must continue to play a vital role in our nation's transportation network in the next century. We look forward to working with you in achieving this goal.

Consolidated Rail Corporation
U. S. House of Representatives
Subcommittee on Surface Transportation
Committee on Public Works and Transportation Hearing
September 17, 1990

Good Morning. My name is William B. Newman, Jr., and I am Vice President and Washington Counsel for Conrail, and am accompanied by Brian H. Vogel, Director of Competitive Policy, Association of American Railroads, and four fellow Conrail employees, Dennis Appleman, Chairman-Juniata Local Number 1639, International Association of Machinists and Aerospace Workers; Allen T. Butterbaugh, General Chairman-Lodge 105, United Railroad Supervisors Association; Michael Giansante, Local Chairman, International Brotherhood of Electrical Workers; and Mr. Thomas D. Lutton, President, Transport Workers Union of American, Local Union No. 2017. We are here to strongly urge the Congress not to increase the limits on the weight and size of trucks allowed to travel the nation's highways.

We start by noting the substantial unused capacity in the rail network which can be part of the resolution of the many serious problems with our transportation infrastructure. The growing congestion, pollution problems and fuel consumption associated with highway traffic can be alleviated by greater use of the non-congesting, environmentally benign, fuel-efficient rail mode. Equally as important, greater use of the rail network will permit the limited resources in the highway trust (when compared to the infrastructure investment demands) to be invested so as

to maximize the use of these scarce tax dollars. The key to greater utilization of the rail mode is not to further tilt public policy against the rail mode. We believe that authorizing the use of longer combination vehicles (LCVs) would tilt public policy against the rail mode so as to seriously threaten the rail industry, and foreclose the opportunity for the public sector to capitalize on the railroad industry's investment in infrastructure in the face of serious questions about the safety of such vehicles, that has led to documented public opposition to them.

The Association of American Railroads has estimated that the railroad industry would lose a 9 percent of its revenues and 52 percent of its operating income to LCVs, if their use were authorized. Some of that income would be lost from traffic that LCVs would capture outright. More would bleed away because of rates forced down to artificially low levels as railroads try desperately to hold as much business as possible. Remaining rail customers would have to pay a larger portion of the cost to maintain the industry's fixed assets.

Because Conrail's markets are highly truck competitive, we estimate that up to 40 percent of our revenues -- about $1.5 billion -- could be lost to LCVs, which will be able to outstrip the carrying capacity of our equipment. Twin 48-foot or triple 28-foot combinations, for example can hold as much as 140 percent of the cubic capacity of the rail industry's standard boxcar.

The results of such a dramatic decline in revenue and income will be devastating for Conrail, and more importantly, for its employees. Here in Blair County, for instance, Conrail employs more than 1,700 people -- approximately 1,200 in its major locomotive repair and freight car repair shops, and another 500 in train service, track maintenance, supervisory and clerical jobs. A 40 percent decline in revenues will force Conrail to reduce expenses commensurately, thereby leading to the commensurate reduction in Conrail jobs here in Altoona because less traffic demands fewer trains, fewer trains demand fewer train service employees and less locomotives and freight car use results in fewer jobs for the employees who maintain that equipment and finally, fewer employees means less revenue to the railroad retirement fund. In short, Altoona, a city which is steeped in railroad history, would be on the vanguard of absorbing the economic havoc LCVs would rein upon the rail industry.

The same effects felt here in Altoona will be felt across our entire system. Multiply those effects by the number of railroads operating across the country, and you begin to see the sobering impact LCVs would have on employment in our industry.

Longer combination vehicles, at weights of up to 135,000 lbs., compared to the current 80,000 limit, represent an enormous burden for our nation's already exhausted highway and bridges, and a serious threat to the

safety of the motoring public as well. That's why the AAA, the Advocates for Auto and Highway Safety, the American Insurance Association, the Sierra Club, the Joint Council No. 7 of the Teamsters, the National Taxpayers Union, have all testified before your subcommittee in strong opposition to LCVs.

Hidden behind that smokescreen of trucking industry's claims of higher productivity is the fact that rail-competitive trucks now pay substantially under for the damage they do to the nation's roads and bridges. FHWA and numerous states have documented that the rail competitive trucks pay only 55-60 percent of the damage they cause to the highway network and that underpayment is calculated on a direct cost basis. If the indirect, the social and the capital costs of heavy trucks are calculated, that underpayment escalates sharply. That's not productivity; it's a subsidy, because it allows trucks to offer low rates without footing the entire bill, placing railroads at a public policy disadvantage and saddling the nation's motorists with the burgeoning costs of repairing our highways.

To allow larger, heavier trucks on the highways will only swell that subsidy. A full-loaded twin-48' does 1.9 times the payment damage of a single 48 with the same payload -- yet pays 31% less per ton mile in federal taxes. The twin-48 would cover only 18% of its total cost. In addition, portions of the highway system are not even

configured to accommodate trucks of the size being proposed, as the California Department of Transportation documented a few years ago in actual demonstrations. At a time when the federal budget is spread thinner and thinner each year, we must question whether taxpayers should continue to finance a mode of transportation bearing such an expensive price tag, especially when alternatives are available.

But these underpayments pale in comparison to the issue of the safety of the motorists who must share the highways with increasingly larger and heavier trucks. Trucks already account for nearly a third of all fatal highway accidents. Numerous independent studies, and many professional truck drivers, have raised serious questions about the ability of double and triple-trailer combinations to be operated safely. The trucking industry claims that operation of certain LCVs to date proves them to be safe, but that limited experience is based by and large on heavily supervised operations in sparsely populated states, often only in good conditions. A recent study commissioned by the Association of American Railroads, by Scientex shows the incidence of fatal accidents with existing doubles to be substantially greater than single trailer trucks. What would one expect from heavier, longer vehicles?

Railroads pose none of the social problems associated with larger trucks. The nation's railroads are efficient. We have the ability to dramatically increase, even double, our freight-carrying capacity at no cost to the taxpayer.

Railroads are privately funded. We pay the cost of maintaining our own roadbeds, track and signaling systems. In fact, railroads spend about $7 billion every year to improve and maintain track and signals.

Railroads are more fuel-efficient. What we can haul with three to five locomotives requires 200 tractors to move over the highway, at a substantial increase in fuel consumption and air pollution.

Railroads are safer. On a per-billion ton-mile basis, trucks experience 10 times as many accidents as railroads and three times as many fatalities.

There is simply no need to absorb the substantial increase in social costs LCVs will impose, particularly when railroads --a safer, more fuel efficient, cleaner, privately financed mode of transportation -- have excess capacity available to handle the needs of the shipping public.

I urge you to keep the nation's highways closed to larger, heavier trucks.

An AAR/Intermodal Policy Division Report

Volume I, Number 8

DOUBLES' UNSAFE RECORD IMPLIES LCV RISKS

L. Lee Lane
(202) 639-2163
August 24, 1990

INTRODUCTION

This Competitive Policy Reporter summarizes the principal findings of a Scientex, Incorporated study of multi-trailer combination vehicle safety. The study was conducted by Roger D. Mingo, Joy R. Esterlitz, and Bret L. Mingo under a contract with the Association of American Railroads.

The summary makes four key points:

- The Scientex study found that fatal accident rates for current doubles are 22-42 percent higher than for tractor semi-trailers;
- The operational characteristics of multiple combination vehicles have contributed to the cause or severity of many accidents;
- The statistical accident experience with existing longer combination vehicles (LCV) operations sheds little light on LCV safety; and
- The logic of this study has been to examine the safety record of western doubles in order to predict the safety of LCVs if operated more widely.

EXHIBIT I

HIGHWAY FATALITY INVOLVEMENT RATES
1988 NATIONAL AVERAGE

NHTSA Fatal Accident Reporting System

EXHIBIT II

TIFA FATALITY INVOLVEMENT RATES
1986 NATIONAL AVERAGE

TIFA (Trucks Involved in Fatal Accidents)

I. THE SCIENTEX STUDY FOUND THAT FATAL ACCIDENT RATES FOR CURRENT DOUBLES ARE 22-42 PERCENT HIGHER THAN FOR TRACTOR SEMI-TRAILERS.

A. This Study Used The Latest Year Of Each Of The Two Best Sets Of Fatal Accident Data Available: NHTSA's Fatal Accident Reporting System (FARS) For 1988 And The Trucks Involved In Fatal Accidents (TIFA) Database For 1986.

Travel data came from state reports to the Federal Highway Administration (FHWA) adjusted to match FHWA control totals. FARS shows a fatality involvement rate for multi-trailer trucks (virtually all "western" doubles -- twin 28s) that is 22% higher than for single trailer combination vehicles, 49% higher than for single unit trucks, and 72% higher than for passenger vehicles (Exhibit I).

TIFA, which goes to great effort to verify vehicle type and finds more doubles, shows fatal accident rates for multi-trailers that are 47% higher than for single trailer vehicles and 118% higher than for single unit trucks (Exhibit II).

B. The More Doubles Operations Resemble Those Of Conventional Trucks, The Higher The Fatal Accident Rates.

Doubles tend to be used in special circumstances, usually for longer hauls on safer highways than other trucks. A major exception is in California, where "western" doubles are used more like other trucks than in any other state. The 1988 FARS shows the fatality involvement rate for doubles in California to be 98% higher than for single trailer combinations, 115% higher than for single unit trucks, and 173% higher than for passenger vehicles (Exhibit III).

C. When Heavy Trucks Collide With Passenger Vehicles, The Occupants Of The Passenger Vehicle Are Far More Likely To Be Seriously Or Fatally Injured Than Are The Occupants Of The Truck.

Published figures from the 1988 FARS show that in accidents involving heavy trucks, approximately six passenger vehicle occupants are killed for every one heavy truck occupant. Most of the heavy truck fatalities, however, resulted from single vehicle accidents. Many of the rest resulted from collisions between two or more trucks, with no passenger vehicles involved.

EXHIBIT IV

HEAVY TRUCK/AUTO COLLISIONS
29 TO 1 KILL RATIO

EXHIBIT V

MULTI-TRAILER TRUCK/AUTO COLLISIONS
45 TO 1 KILL RATIO

D. When Two-Vehicle Collisions Between A Heavy Truck And A Passenger Vehicle Are Considered, The "Kill Ratio" Increases Five-Fold To About 29 Passenger Vehicle Occupants Killed For Each Heavy Truck Occupant Killed (Exhibit IV).

E. The Passenger Vehicle-To-Truck Kill Ratio For Multi-Trailers Is Much Worse Than For Conventional Trucks.

In a two-vehicle collision between a passenger vehicle and a multi-trailer combination vehicle, there are 45 passenger vehicle occupants killed for each multi-trailer occupant killed (Exhibit V).

II. THE OPERATIONAL CHARACTERISTICS OF MULTIPLE COMBINATION VEHICLES HAVE CONTRIBUTED TO THE CAUSE OR SEVERITY OF MANY ACCIDENTS.

A. Data From The 1988 FARS Confirms A Higher Fatality Rate For Doubles Than For Singles For Accidents Involving Jackknifing Or Rollover.

Doubles are more prone to each of these phenomena than are single trailer combinations.

B. And The Operating Characteristics Of LCVs Are Known To Be Inferior To Those Of Tractor Semi-Trailers.

FHWA's 1985 study, *The Feasibility of a Nationwide Network for Longer Combination Vehicles*, reported that large multi-trailer vehicles are poorer at accelerating, maintaining highway speeds, offtracking, and maintaining adequate braking than conventional tractor semi-trailers. A recent University of Michigan Transportation Research Institute study found that length, weight, and number of trailers all have significant influence on low and high-speed offtracking, ability to brake in a straight line, rollover, and turn handling.

C. Moreover, There Is Extensive Anecdotal Evidence Showing The Contribution Of Operating Characteristics To Specific Accidents.

FHWA's Motor Carrier Accident Reporting System, while severely underreporting motor carrier accidents, provides many examples of LCVs involved in lane change, sideswipe, merging, and other such accidents where their operating characteristics could have been substantial contributing factors.

D. And Many Truck Drivers Regard Multiple Combinations To Be Unsafe.

In the 1986 FHWA study *Longer Combination Vehicle Operations In Western States*, a number of truck drivers wrote to the public docket to say that they considered triples to be unsafe vehicles with poor operating characteristics, particularly in bad weather. In addition, several surveys of triples drivers have shown widespread concern for the safety of their vehicles.

E. LCV Operating Characteristics Suggest They Would Be Even Worse Than Western Doubles.

Triples are worse than western doubles with respect to every operating characteristic that has potential safety consequences. Turnpike and rocky mountain doubles are worse in most of the important characteristics, the major exception being whip and sway. The higher gross weights are one factor that makes them inherently even more hazardous than are western doubles; the extra articulation of triples is another factor. Under identical operating conditions, LCV accident experience would clearly be expected to be worse than single trailer vehicles and even worse than western doubles operations. There would be more accidents, more severe accidents, more fatalities, and a higher kill ratio.

III. THE STATISTICAL ACCIDENT EXPERIENCE WITH EXISTING LCV OPERATIONS SHEDS LITTLE LIGHT ON LCV SAFETY.

A. Previous LCV Safety Studies Have Had Severe Limits In Sample Size And Data Reliability.

Vehicle configurations are inadequately and unreliably reported on state accident reporting forms. Current traffic data relies upon biased sampling methods with conjectural correction factors or no correction factors at all. The studies relying upon this data have therefore been inconclusive in demonstrating whether or not current special restrictions and operating conditions are sufficient to keep LCV accident rates close to tractor semi-trailer accident rates.

B. Moreover, LCVs Are Currently Used Only Under Special Conditions.

LCVs are limited in which roads they can travel on, what hours of the day, and what kind of weather conditions. They have special equipment requirements and are usually given the best drivers. They are subject to special, revokable permits and special inspections.

C. Experience Under Special Conditions Cannot Be Extended To General Conditions.

Even if accident and travel data were available with sufficient quality and in sufficient quantities reliably to determine current accident rates (which it is not), this would be of limited use in predicting LCV safety if their use were more widespread. As the California safety experience with western doubles shows, we could expect a large increase in fatalities and accidents if LCVs were permitted in more places or with fewer restrictions.

IV. THE LOGIC OF THIS STUDY HAS BEEN TO EXAMINE THE SAFETY RECORD OF WESTERN DOUBLES IN ORDER TO PREDICT THE SAFETY OF LCVS IF OPERATED MORE WIDELY.

A. If Western Doubles Have Inferior Safety Performance, Then LCVs, Which Have Even More Severe Operational Problems, Should Represent An Even Greater Safety Threat.

The FARS and TIFA data show that western doubles do, in fact, have a poorer safety record than tractor semi-trailers. The especially poor record in collisions with automobiles (the enormous difference in "kill ratio" between auto and truck passengers) suggests, too, that the danger to automobiles is a particular problem. The same phenomenon also implies the existence of a driver incentive problem for trucks.

And the California data shows that the safety of western doubles deteriorates sharply as their operations become more commonplace.

B. The Quality Of Available Data Will Improve Within A Few Years.

The National Governors Association has developed a model accident reporting form that states are expected voluntarily to implement. Vehicle configuration data will become more uniform and reliable than at present. Similarly, FHWA has recently issued the *Traffic Monitoring Guide*, which calls for much more statistically reliable traffic data collection by state highway agencies. The superior data that will be collected by states will allow more reliable determination of relative accident rates. If past patterns hold, it is likely that the accident rate of doubles and other less-common vehicles will appear to rise substantially as the degree of underreporting is reduced.

C. The Substantial Safety Problems Of Western Doubles Operations Argue Against Expanded LCV Operations Unless And Until New Data Shows That These Problems Can Be Overcome.

When the most reliable and available large national accident and vehicle travel databases are used to derive estimates of accident involvement rates, it is clear that existing doubles are much more dangerous than conventional tractor semi-trailers. If LCVs were used under the same conditions as current doubles, their accident rates would be even higher. Until the new data shows that the accident problems associated with multi-trailer combinations have been overcome, more widespread use of LCVs would represent a serious safety risk.

If you have questions or seek further information, please contact L. Lee Lane at (202) 639-2163.

Testimony Presented by:

Kenneth H. Quigley
Executive Director
Appalachian Thruway Association

Monday, September 17, 1990
Altoona, Pennsylvania

Good morning. I represent the Appalachian Thruway Association. We are a private, grassroots organization working to improve the Appalachian corridor that stretches from Cumberland, Maryland through Central Pennsylvania to Corning, New York. Individuals, businesses and local governments make up the bulk of our membership.

Today, more than two-thirds of the 238-mile highway is either complete, under construction or in final design phases. The Thruway connects eight major east-west highways, including three Interstate highways, and it the only major north-south highway through central Pennsylvania.

I would like to make just two main points today:

1. Improved highways are crucial to the quality of life in the rural areas and small cities of our nation.

2. The federal Appalachian Development Highway Program has been a godsend for the Appalachia region of the nation and should be extended and augmented under any new federal transportation policy.

First, a few reasons why highways are so important to us...

Obsolete and deteriorated highways are unsafe highways. A case in point is the 62-mile section of the Appalachian Thruway between Williamsport and the New York State line. During the past six years, there have been 1,054 serious accidents. 1,165 people were injured and 62 people died. That averages out to about 15 accidents, 16 serious injuries and one death per month. That has been happening for every month for the past six years.

Or consider the fact that within three years we will have a beautiful, four-lane limited access highway that extends from the Pennsylvania Turnpike north toward Interstate 80 for more than 60 miles, only to empty onto unimproved, two-lane, hilly road through small towns -- 20 miles short of the Interstate.

In a very real way, our very lives depend on highway improvements.

Secondly, the Appalachian Region of the nation has lagged behind the rest of the nation in terms of economic development and growth. Safe, modern highways, we believe, can help to make up that difference.

A recent ARC survey underscores our faith. It found

that 81 percent of the 695,000 jobs created in the Appalachia region between 1980 and 1986 were located in the 241 Appalachian counties were there was a completed Appalachian Development or Interstate Highway.

A study completed last November on the impact of the completed sections of the Thruway in Blair and Bedford Counties revealed that commercial building permits in the Altoona area increased by 500 percent between 1987 and 1988. Also, between 1985 and 1989, 52 companies invested nearly $50 million to expand plants or establish new operations in Blair County alone, creating 2,500 new jobs.

And the corridor is not yet complete.

Thirdly, tourism provides a major source of revenue for rural counties. A study we completed several years ago concluded that the growth rate for tourism in the corridor would increase at twice the national average over 10 years if the highway were completed. Today, even with the highway still incomplete, we are seeing numerous tourism destinations being developed throughout the region.

My second main point is this. The highway development funds of the Appalachian Regional Commission have made a world of difference in Appalachia. Since it began in 1965, the nation has invested millions of dollars in the region; and it is now beginning to pay off.

However, the Appalachian Development Highway System,

promised by Congress so many years ago, is not complete. At the current rate of funding it will not be complete for another 75 years.

We cannot wait that long.

Thanks to strong support in the House, the ARC's highway program survived attempts by the Reagan administration to abolish it. And thanks to special efforts by Congressman Shuster we have been able to address the transportation needs of the City of Altoona and the Central Pennsylvania region.

But the job is not done. In your efforts to address the nation's transportation needs ... urban gridlock, suburban sprawl, mass transit, Interstate maintenance and more ... the needs of America's small cities and rural communities must not be neglected.

As you redraft the Federal Surface Transportation Act, and wrestle with how to spend down the unobligated balance in the Federal Highway Trust Fund, which we feel you must do, consider the unfinished Appalachian Region Development Highway System. Consider the transportation needs of rural and small town America. Consider the importance of Interstate Connectors, like the Appalachian Thruway, not only to the region, but to the nation as well.

In Money magazine's list of the "Top 100 Places to Live in America" for 1989, four of the cities listed are

located along the Appalachian Thruway corridor: Cumberland, Maryland; Altoona, State College and Williamsport, Pennsylvania.

We believe this says something significant about the level of community pride that exists in these cities and in other towns and cities along the route of the Thruway. The nation needs these people. It needs these towns to remain strong and to grow. In order to do so, we believe, safe, modern highways must link these communities to one another, and to the rest of the nation.

We ask that you recognize the importance of developmental highways to rural and small town America, and that you extend and augment the Appalachian Development Highway Program as you develop new federal surface transportation legislation.

Thank you.

TESTIMONY

OF

WILLIAM STOUFFER

COMMISSIONER, BLAIR COUNTY, PENNSYLVANIA

BEFORE

U.S. HOUSE OF REPRESENTATIVES

PUBLIC WORKS COMMITTEE

SURFACE TRANSPORTATION HEARING

ALTOONA, PENNSYLVANIA

SEPTEMBER 17, 1990

TESTIMONY OF WILLIAM STOUFFER, COMMISSIONER OF BLAIR COUNTY
BEFORE THE HOUSE PUBLIC WORKS COMMITTEE
SURFACE TRANSPORTATION HEARING
SEPTEMBER 17, 1990, IN ALTOONA, PENNSYLVANIA

MR. CHAIRMAN, I EXPRESS MY APPRECIATION TO ADDRESS THIS GROUP THIS MORNING. MY NAME IS BILL STOUFFER. A SIGNIFICANT PART OF MY LIFE HAS BEEN DEVOTED TO PUBLIC SERVICE. PRESENTLY, I SERVE AS COMMISSIONER FOR BLAIR COUNTY AND RECENTLY WAS ELECTED TO SERVE AS CHAIRMAN FOR THE TRANSPORTATION TECHNICAL ADVISORY GROUP OF THE SOUTHWESTERN PENNSYLVANIA HERITAGE PRESERVATION COMMISSION.

FURTHERING THE IMPROVEMENT OF ACCESS INTO AND WITHIN OUR REGION HAS BEEN A FUNDAMENTAL PRIORITY AND CONSTANT PURSUIT OF MY PUBLIC CAREER.

WE ARE EXTREMELY GRATEFUL FOR THE EXCEPTIONAL CONTRIBUTION THAT CONGRESSMAN SHUSTER HAS PERSONALLY MADE TO THE DEVELOPMENT OF A MORE EFFICIENT AND SAFE HIGHWAY SYSTEM IN OUR REGION. HIGHWAY IMPROVEMENTS LIKE U.S. 220 BETWEEN ALTOONA AND BEDFORD ARE INVALUABLE TO THE QUALITY OF LIFE AND FUTURE ECONOMIC WELL-BEING OF OUR COMMUNITIES.

WHILE WE APPLAUD THESE NOTABLE ACCOMPLISHMENTS, THERE REMAINS SERIOUS GAPS IN VITAL HIGHWAY LINKAGES THAT ARE CRIPPLING REGIONAL DEVELOPMENT OPPORTUNITIES IN OUR AREA.

PORTIONS OF U.S. 22 ARE A GOOD EXAMPLE OF WHAT I AM TALKING ABOUT. U.S. 22 HAS ALWAYS BEEN AN ESSENTIAL ECONOMIC AND REGIONAL LINE TO OUR AREA WEST OF HARRISBURG. DURING THE UPDATE OF THE PENNSYLVANIA DEPARTMENT OF TRANSPORTATION'S "1984-1996 12-YEAR BRIDGE AND HIGHWAY PROGRAM," A PLANNING STUDY WAS INITIATED FOR THE SECTION FROM CUBA MILLS IN JUNIATA COUNTY TO HOLLIDAYSBURG IN BLAIR COUNTY. THE STUDY, WHICH SHOWS OPTIONS AVAILABLE TO PENNDOT FOR IMPROVING U.S. 22, WAS COMPLETED IN MARCH 1989. THESE OPTIONS INCLUDED PROJECTS FROM MINOR IMPROVEMENTS TO CONSTRUCTING A COMPLETE FOUR-LANE RELOCATION.

UNDER ITS CURRENT 12-YEAR PROGRAM (1988-2000), PENNDOT HAS ELECTED TO ADD $10 MILLION TOWARD IMPROVEMENT PROJECTS ALONG THE CUBA MILLS TO HOLLIDAYSBURG CORRIDOR. ALSO INCLUDED ARE THREE BYPASS STUDIES AT LEWISTOWN, WATER STREET AND HOLLIDAYSBURG.

THE ENTIRE SECTION OF U.S. 22 FROM MUNDYS CORNER TO MONROEVILLE HAS ALSO BEEN PLACED ON THE CURRENT PROGRAM FOR RECONSTRUCTION TO FOUR LANES ON EXISTING ALIGNMENT IN VARIOUS FOUR-YEAR PERIODS. PROJECTS IN THE FIRST FOUR-YEAR PERIOD BEGIN AT THE MONROEVILLE END HEADING EAST, WITH THE MUNDYS CORNER PROJECT IN THE THIRD FOUR-YEAR PERIOD.

WE REAFFIRM OUR COLLECTIVE DETERMINATION THAT IMPROVEMENTS TO U.S. 22 BE EXTENDED AND THE HIGHWAY BE DEVELOPED AS A PARKWAY-LIKE, LARGELY LIMITED ACCESS, FOUR-LANE FACILITY THAT PROVIDES A SAFE AND QUALITY DRIVING EXPERIENCE FOR AREA RESIDENTS AND COMMERCIAL TRAFFIC BETWEEN PITTSBURGH AND HARRISBURG.

WE ALSO HOPE THAT NO SERIOUS CONSIDERATION WILL BE GIVEN TO THE IDEA OF USING FEDERAL HIGHWAY REVENUE FOR ANYTHING UNRELATED TO THE RESEARCH, DEVELOPMENT, INTERPRETATION AND MAINTENANCE OF OUR NATIONAL TRANSPORTATION SYSTEM.

SOUTHWESTERN PENNSYLVANIA EMBODIES THE COMPLETE HISTORICAL SPECTRUM OF SURFACE TRANSPORTATION DEVELOPMENT IN THIS COUNTRY.

CONGRESSMAN SHUSTER'S HOME, BEDFORD COUNTY, HAS CAPITALIZED ON THE OPPORTUNITY MADE POSSIBLE BY AMERICA'S INDUSTRIAL HERITAGE PROJECT TO SHOWCASE THE REGION'S RICH TRANSPORTATION HISTORY BY ADOPTING THE THEME, "TRAILS TO TURNPIKES." THE COUNTY PLANS TO DEVELOP A TRANSPORTATION MUSEUM AS AN INTEGRAL PART OF A NINE-COUNTY EFFORT TO ENCOURAGE ECONOMIC DEVELOPMENT AND TOURISM BY PRESERVING AND INTERPRETING KEY HISTORIC RESOURCES AND THEMES.

THE LEGISLATION CONCEIVED BY CONGRESSMAN MURTHA THAT ESTABLISHED AMERICA'S INDUSTRIAL HERITAGE PROJECT (A.I.H.P.) ALSO PROVIDED FOR THE DESIGNATION OF EXISTING STATE ROADS INTO A SYSTEM OF INDUSTRIAL HERITAGE ROUTES LINKING HISTORICAL SITES AND OTHER ATTRACTIONS WITHIN THE REGION. THIS PROVISION IS LISTED UNDER TITLE II OF PUBLIC LAW 100-698.

THIS INDUSTRIAL HERITAGE ROUTE IDEA HAS GENERATED CONSIDERABLE ENTHUSIASM AND HAS SUBSTANTIATED THE VIEW OF AMERICANS' ENDURING ROMANCE WITH THE ROAD.

BECAUSE OF THE ABSENCE OF A NATIONAL SCENIC BYWAYS PROGRAM COMBINED WITH THE FACT THAT THE COMMONWEALTH OF PENNSYLVANIA HAS NOT OFFICIALLY ADOPTED A SCENIC ROAD PROGRAM, AS CHAIRMAN OF THE TRANSPORTATION COMMITTEE FOR A.I.H.P., I APPOINTED A SEVEN-MEMBER TASK FORCE IN APRIL 1988 TO DEVELOP A PROCESS FOR IMPLEMENTING TITLE II OF PUBLIC LAW 100-698. THE TASK FORCE WAS MADE UP OF REPRESENTATIVES FROM THE NATIONAL PARK SERVICE, PENNDOT, PENNSYLVANIA HISTORICAL MUSEUM COMMISSION, THE TOURISM INDUSTRY, AND THE STATE LEGISLATURE.

THE WORK DONE BY THIS GROUP, WITHOUT THE BENEFIT OF A NATIONAL PROGRAM, HAS BEEN ADMIRABLE, AND I BELIEVE THEIR PLAN COULD SERVE AS A NATIONAL MODEL.

THE SUCCESS OF AIHP TO THIS POINT HAS BEEN THE GENUINE PARTNERSHIP BETWEEN GOVERNMENT AND THE PRIVATE SECTOR. EACH SERVES CLEAR ROLES WITH SPECIFIC RESPONSIBILITIES. WE VIEW SCENIC BYWAYS SIMILARLY -- WITH SPECIFIC FEDERAL, STATE AND PRIVATE-SECTOR ROLES.

THE FEDERAL ROLE, AT A MINIMUM, SHOULD INCLUDE TECHNICAL AND FINANCIAL ASSISTANCE IN SUPPORT OF SCENIC BYWAYS. THE COORDINATION OF REGIONAL, STATE AND FEDERAL AGENCY SCENIC BYWAYS PROGRAMS WOULD ALSO SEEM BEST SERVED AT THE NATIONAL LEVEL.

IN CLOSING, LET ME STATE OUR STRONG SUPPORT FOR A SCENIC BYWAYS COMPONENT IN THE 1991 HIGHWAY BILL.

US HOUSE OF REPRESENTATIVES

SURFACE TRANSPORTATION SUBCOMMITTEE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SEPTEMBER 17, 1990

STATEMENT OF

C. WILLIAM WARD

WARD TRUCKING CORPORATION
REPRESENTING THE

PENNSYLVANIA MOTOR TRUCK ASSOCIATION.

INTRODUCTION

Thank you for the opportunity to testify concerning the future of the Federal-aid highway program and related surface transportation issues. I am pleased to share with you the views of both the Pennsylvania Motor Truck Association as well as the American Trucking Associations.

Trucking is essential to the economic well-being of states' like Pennsylvania. A glance at some fundamental facts about the motor carrier industry in Pennsylvania will confirm trucking's critical role in ensuring the continuation of the state's economic vitality. Based on 1988 data, the industry:

- Employs 353,322 persons
- Had a payroll in 1988 totaling over $7.5 billion
- Serves all of Pennsylvania populated communities of which 80.6% depend entirely on trucks
- Paid $871 million in 1988 State and Federal Highway Taxes, accounting for 58.6% of the total state and Federal Highway Tax receipts paid by all motor vehicles, approximately $16.8 million each week.
- Trucks paid $381.8 million in State Highway User Taxes 34.7% of the total paid by all motor vehicles
- State and Federal Highway User Taxes paid on one large truck combination are 45 times greater than those paid by one medium passenger car.

Nationally too trucks have become the carrier of choice of America's shippers. Over 77% of the value of everything America grows and produces now moves on trucks. Freight revenue now exceeds $240 billion annually, and the trucking industry generates fully 5% of this Nation's gross national product. The trucking industry employs 7.5 million Americans, and pays them $160 billion in wages annually. Trucks pay over $50 million a day in highway use taxes which represents more than 45% of all state and federal taxes paid.

This testimony will present further information on six critical areas for your consideration:

- Program Structure
- Program Finance

- o Safety
- o Highway Design
- o Productivity
- o Related Issues

Program Structure:

We believe that the preservation, expansion, and reconstruction of the National System of Interstate and Defense Highways and major primary highways of national concern should be the cornerstone of a new Federal highway program. Other arterial routes necessary to develop a national network should be included in the system.

More specifically, the new national system should consist of 140,000 to 180,000 miles which will effectively connect all of the nation's population centers and accommodates approximately 45% of all traffic movements, including 70% of all commercial traffic.

Primary or arterial routes which are incorporated into the Highways of National Significance should be upgraded to standards adequate for the traffic volumes and vehicle populations using such routes on a priority basis. These routes which will carry more than 70% of the nation's intercity freight will require increased funding to meet these higher highway standards. Some may need to be upgraded to near Interstate System standards but many may simply need to be rehabilitated to modern geometric standards and to provide for adequate traffic movement.

Full Federal-aid funding, as now authorized, should be provided through FY 1991. After completion of the Interstate System, the Highways of National Significance must become the principal Federal aid system. This system should be funded at a level to meet essential future needs and at a higher Federal aid matching ratio than any other Federal aid highways. Fund distribution to the new system should be by an equitable formula.

Federal aid should continue for major bridges and for secondary and urban roads off the National system to improve urban, suburban and rural mobility. Many interstate freight movements begin or end on lesser rural and urban primary and secondary routes and federal aid programs should support major construction projects on these routes.

Accordingly, a significant federal aid program for routes not included on the new National system will remain a high priority for the trucking industry. Increased federal highway

spending should be sought for these categories through 1995 either by reducing specific categories or by block grant programs with some restrictions on use.

Program Finance:

The money is in the Federal Highway Trust Fund now to start this program with funding at an annual funding level of $18 billion. No new taxes are needed and none should be considered until the current fund balances in the Highway Trust Fund are adequately committed. Shifting the burden to state and local funding denies the national nature of the highway program. Continued federal funding for major secondary and urban road projects and for bridges is also needed and can be supported by this level of funding.

While DOT refers to tolls as a "limited" option, tolls do receive a great deal of emphasis in the National Transportation Policy. ATA strongly opposes any new tolls on existing roads. There should be no mixing of Trust Fund dollars with toll road bond funds. Some limited use of toll financing for congestion relief or other specified purposes could be considered in specific instances.

Expansion of the use of Highway Trust Fund dollars for purposes other than highways is not a viable option and should not be considered. Shifting a greater burden of highway construction cost to state and local governments could mean a back door tax increase and lead to the deterioration of the concept.

There is evidence of continued excise tax evasion. While the Internal Revenue Service has voiced concerns they have done little to stop it. We believe that the use of Federal Highway Trust Fund monies to enhance State and Federal highway tax enforcement efforts will also pay large dividends. ATA supports the emphasis contained in the National Transportation Strategy to curtail excise tax evasion. Proper audit and enforcement could add $1 billion to the Highway Trust Fund. And the elimination of 'gasohol' exemptions could also add nearly $500 million to the Trust Fund every year.

Safety:

According to the Fatal Accident Reporting System (FARS) of the U. S. Department of Transportation (the most reliably collected truck accident data on a national scale) the data from

1976 to 1986 indicates that fatal accident rates per million truck miles have steadily fallen through the 1980's. (See chart below)

Fatal Accident Statistics for Combination Vehicles

1976-86

	Number of Fatal Accidents	Vehicle Miles Traveled (billions)	Fatal Accident Rate (per 100 million miles)
1976	3260	49.7	6.56
1977	3613	55.7	6.49
1978	4066	63.0	6.45
1979	4307	67.0	6.43
1980	3731	68.7	5.43
1981	3863	69.1	5.59
1982	3519	66.7	5.28
1983	3545	69.8	5.23
1984	3907	77.4	5.05
1985	3892	79.6	4.89
1986	3825	82.7	4.63

Note: Combination vehicles include all separate tractor-trailer combinations.

The Motor Carrier Assistance Program has been an extremely successful federal - state partnership to reduce commercial motor vehicle accidents. The program has received increased funding levels every year to its present level in FY 90 of $60 million. We believe the program should continue and that funding should be increased. We believe that increased funding should be directed towards providing more effective training for inspectors charged with the responsibility of inspecting commercial motor vehicles.

Since 1974, almost $5 billion has been obligated from the Highway Trust Fund for rail-highway crossing improvements under the section 130 rail-highway crossing program, other Federal-aid programs, and the section 163 railroad relocation demonstration program. Almost 40% of these funds have come from Federal Highway user fees paid by the trucking industry into the Highway Trust Fund.

Because these programs provide substantial benefits to the railroad industry, the law requires the railroads to contribute private funds to individual projects. Under section 130(b) of title 23, the railroads are required to contribute up to 10% of total project costs which the Secretary determines will represent the net benefit to the railroads of each project type.

Unfortunately, the regulations under which the railroads have operated since 1975 have served to limit their required contributions to a minuscule level, perhaps 1% of Federal-aid project costs. These sweetheart regulations should be reevaluated to assure that the railroads pay their fair share of rail-highway crossing project costs.

Highway Design:

A recent study by Kenneth A. Small, Clifford Winston and Carol A. Evans, Road Work, published by the Brookings Institution, observes that the trucking industry and the Nation are paying a steep price for suboptimally designed pavements and that "trucks would damage roads far less if roads were correctly built in the first place." In reaching this conclusion, the study assumes life cycle highway costs would be minimized through optimal highway design -- in their words, by adding "pavement thickness (or other measures to improve durability) until the incremental cost of additional durability equaled the incremental savings in maintenance and (highway) user costs." With these durability improvements, the study suggests that the costs attributable to heavy combination vehicles would be 1/3 less than their current road user charges.

The economies of scale of building stronger and thicker pavement structures are enormous. According to American Association of State Highway and Transportation Officials (AASHTO) design procedures, one additional inch of pavement effectively doubles the strength (and life) of the pavement yet adds only 4% to pavement related construction costs and less than 1/2 of 1% to the total construction costs of a rural Interstate highway (according to Federal Highway Administration [FHWA] cost data). Virtually without exception, the incremental savings in future highway maintenance, rehabilitation and highway user costs will far outweigh the incremental costs of thicker pavements.

A typical concrete pavement section on rural Interstate highways today is 10" thick. According to current AASHTO design procedures, this design will accommodate a minimum of 5 million 18,000 pound axle load applications (or its equivalent). Eight times more durable than a 10" concrete pavement, a 14" concrete pavement adds but 15% to pavement related construction costs and less than 2% to the total construction cost of a new highway. Pavements on main line truck routes should be built at least 14" thick.

The economies of scale of thicker pavements have long been acknowledged by the highway engineering profession. In testimony before Congress, FHWA has stated that pavement strength goes up with the seventh power of pavement thickness.

We strongly recommend that the Nation begin building and rebuilding its major highways with stronger and thicker pavement structures and better draining base courses. This strategy will increase the probability that pavements will last their intended lives, dramatically reduce life cycle pavement and highway user costs, and make the transportation sector a more productive part of the economy.

Productivity:

Highway freight transport is the largest freight transportation element in the gross national product -- by a large margin. But its importance far transcends direct dollar input to GNP because it is so interwoven in the fabric of virtually every other economic activity in our complex modern economy. For that reason, improved truck productivity could greatly benefit our domestic economy and will be vital to our competitive position in the international markets of the next decade. Arbitrary caps on truck productivity, like the federal 80,000 pounds GCW limit are artificial handicaps. They are exacting a price from every consumer, producer and exporter in the nation -- which collectively amounts to billions of dollars annually. This fact was discussed in detail in the recent Transportation Research Board (TRB) Special Report -- Truck Weight Limits: Issues and Options. One of TRB's major recommendations is a permit program that would allow states to authorize the use of vehicles with gross weights over the 80,000 pound limit provided such programs control the characteristics and operations of these vehicles and require permit fees that cover any increases in highway agency costs.

A recently released study by the Trucking Research Institute (TRI) assesses the productivity benefits to the national economy that can be expected if longer combination vehicles were allowed to operate on a national network. The findings are particularly significant for those interested in agricultural economy. A review of Exhibit 10-1 (see attached) reveals that three commodity groups -- farm products, lumber and building materials, and food products -- account for the largest share of the non-LTL (less-than-truckload) savings. The annual saving in the cost of truck transport for these three commodity groups represents about two-thirds of the reduction in non-LTL truck costs. The TRI study is entitled Productivity and Consumer Benefits of Longer Combination Vehicles (May 14, 1990). I would strongly recommend it for your review.

Related Issues and Conclusion:

Beginning in fiscal year 1992, $50 million should be earmarked each year for trucking-related research and development expenditures within the Department of Transportation. These funds should be employed for research, development, and demonstration programs aimed specifically at enhancing trucking safety, productivity and international competitiveness. This research should include efforts to improve off-ramp construction and signing, downgrade signing and truck rest area solutions.

Finally, we urge this Committee to make its decision based on sound economics, engineering, demographics and business and international trade issues. We must not lose sight of these issues and make decisions based on politics. The course we set in this new highway reauthorization legislation will set the stage for our children and our society for years to come.

EXHIBIT 10-1

ANNUAL SHIPPER COST SAVINGS BY COMMODITY GROUP (millions of 1988 dollars)

Commodity Group	For Current Truck Users	For Current Rail Users[1]	Total
Farm products	$ 698	$ 20	$ 718
Mining products	46	13	59

U.S. HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SUBCOMMITTEE ON SURFACE TRANSPORTATION

HEARING ON

REAUTHORIZATION OF THE POST-INTERSTATE

SURFACE TRANSPORTATION PROGRAMS

SEPTEMBER 17, 1990

ALTOONA, PA

Statement by

Howard Yerusalim, P.E., Secretary

Pennsylvania Department of Transportation

1200 Transportation & Safety Building

Harrisburg, Pennsylvania 17120

Mr. Chairman and distinguished members of the Subcommittee, I am Howard Yerusalim, Secretary of Transportation for the Commonwealth of Pennsylvania. I am also Chairman of the Pennsylvania Turnpike Commission, and I would note that this is the first time in the Turnpike's 50-year history that a Secretary of Transportation has served also as Chairman of the Turnpike Commission. On behalf of Governor Robert P. Casey, it is my pleasure to welcome you to Pennsylvania to receive testimony on this most critical transportation issue. Before I begin my testimony, I would like to recognize Congressman Bud Shuster, ranking Minority Member of the Subcommittee, for all his efforts on behalf of the citizens of the Commonwealth of Pennsylvania. I am proud to say that the Casey Administration has enjoyed a fine working relationship with the Pennsylvania Congressional Delegation, and particularly with those members who serve on the Public Works and Transportation Committee -- Congressmen Shuster, Borski, Clinger, and Kolter. And, I would also like to acknowledge the efforts that Congressman Jack Murtha has put forth to improve transportation in this region and throughout the Commonwealth.

Over the past four years, the Commonwealth of Pennsylvania has invested $4.2 billion in its highway and bridge program. In 1989, we opened more miles of new Interstate highways than in any other year over the past two

decades. More than 1200 bridges have been replaced or rehabilitated since 1987. These accomplishments illustrate the success of the federal/state/local transportation partnership. All around us are testaments to the cooperation and positive working relationships the Pennsylvania Department of Transportation shares with our Delegation and the Federal Highway Administration. We now have all the remaining miles of Pennsylvania's Interstate system under construction and expect to have the last segments open to traffic by 1992. We are grateful to Congressman Shuster for the $72 million in special federal funding authorized in the 1987 Surface Transportation Act which will finance the relocation of Route 220 between Altoona and Tyrone. When this link is completed in 1992, U.S. 220, the Bud Shuster Highway, will be a four-lane expressway facility from the Turnpike Interchange at Bedford to Tyrone. And we look forward to continuing the improvement of U.S. 220 north to I-80 as part of a "gateway to Canada." To help us continue, Congressman Shuster has included $2 million in special federal funding for preliminary engineering on the section of U.S. 220 between Bald Eagle and the Centre County line in the House version of the FY 1991 Transportation Appropriation Bill. Also in the Altoona area, the year-old bus testing and research facility represents implementation of a $3.2 million program authorized in the Surface Transportation Act of 1987. New

and modified bus models are tested at this facility before qualifying to be purchased with federal funds.

Thanks to the diligent efforts of Congressman Murtha, the Johnstown area has also been the recipient of $22.5 million in special federal funding for the Ebensburg Bypass in Cambria County, which will be completed next month. Congressman Murtha has also included $20 million in federal funds in the pending FY 1991 Transportation Appropriation Bill for reconstruction of Route 56 in Cambria, Somerset and Westmoreland Counties.

Federal funding is crucial to Pennsylvania's transportation program. Over the last four years the Commonwealth has received $1.971 billion in highway and bridge funds as well as another $685 million for mass transit. We are grateful for additional highway and bridge discretionary and special funds totaling $797 million over that same period, which are so important in supplementing the regular federal-aid program. These federal funds, combined with state, local and private resources, have enabled Pennsylvania to become a national leader in transportation. However, I would note that we could have an even better program if a way could be found to gain full release of the nearly $18 billion in current balances in the federal highway and mass transit trust funds. Moreover, another $7 billion is currently being held in the federal

airport and airway trust fund, bringing the total transportation trust fund balances to approximately $25 billion.

Pennsylvania is also proceeding with major expansions to its highway network through toll financing. Work is underway on the Mon/Fayette Expressway, one of the pilot toll projects authorized in the 1987 Surface Transportation Act. A $55 million section of this new highway will be opened in the near future. Because of the provisions of the 1987 Act, we are able to combine federal funds and toll financing on this project. The Pennsylvania Turnpike Commission also has two other major toll roads under construction in western Pennsylvania at a total cost of more than $500 million without federal participation -- the Beaver Valley Expressway and the Greensburg Bypass. Clearly, we believe that tolling is an important method of financing new highway construction.

Turning now to the challenge at hand -- to undertake what will be the most comprehensive review of the nation's transportation policies and programs in decades and to chart their passage into the 21st century. The formidable challenges that await us all come on the heels of a successful Interstate era, forged in 1956 to link the major activity centers of this country. The time has come to combine the energy and resources of the

federal/state/local/private levels to revitalize our transportation system, the backbone of commerce in the United States. I believe that there is an appropriate role for each level of government in planning, building, maintaining and financing surface transportation facilities. As we look to the year 2000, these roles are changing. Increasingly, there is also a key part for the private sector to play. However, the overriding principle which has guided transportation programs over the past seventy-plus years has been a strong federal/state/local government partnership. This relationship must be nurtured and must continue to evolve even as circumstances change. Change is constant, thus we must be innovative, creative and flexible to anticipate and adapt to change.

Overall, I envision a federal transportation role which is much more sharply focused on setting broad national policy and addressing issues of national significance. Federal financial resources would be targeted in large part to national priorities such as preserving the present Interstate system, other major highways along with major urban and rural arteries, and initiatives to improve safety and reduce congestion. Building on the past, the federal program policies which have worked well are those that represent a firm commitment to a national objective, like the Interstate Highway System. As we enter the post-Interstate era, federal transportation programs

desperately need a new rallying point upon which to base a future commitment of energy and resources. It seems to me that this new theme should focus on improved mobility, with emphasis on finding the most efficient ways to move people and goods, not vehicles. By this I mean that we must find solutions to mobility issues other than just building more highways.

Another major change I see occurring is that the states have become more capable of managing transportation programs and are assuming a larger role. Increasingly, the states realize that a new federal program is not always the proper solution to a transportation problem, and they are demonstrating the ability to successfully launch major transportation initiatives on their own.

For example, in Pennsylvania, we began a Billion Dollar Bridge Program in 1982, which to date has resulted in the replacement or rehabilitation of more than 1,300 bridges at a total cost in excess of $1.4 billion. The key to this success is a dedicated source of state revenue raised through truck registration fees and a motor carrier road tax. The revenues from these sources total more than $72 million per year, which when combined with federal and local funds, has enabled us to undertake a $200 million bridge program each year. We still have much work ahead of us and believe that the continuation of a strong federal commitment

to bridge improvements is critical to the success of our own program. Such a federal commitment is especially appropriate when one considers that by eliminating bridge weight limitations and bridge closings which impede truck traffic, we gain intrastate and interstate commerce benefits which have a positive ripple effect throughout the economy.

In contrast to the bridge success story, there has been a continual and dramatic decrease over the past decade in federal support for mass transit. Federal capital and operating assistance for Pennsylvania mass transit systems has been reduced from $379 million in 1980-81 to $151 million in 1988-89, a drop of nearly 60 percent. Meanwhile, the Commonwealth, with two of the nation's largest transit systems in Philadelphia and Pittsburgh, has significantly increased its state funding commitment. During the state fiscal years from 1979-80 to 1990-91, annual state funding for operating assistance to the Commonwealth's urban transit systems has nearly tripled from $119.3 million to $331.3 million. During the same period, federal operating assistance has dropped from $86.2 million to the $11.4 million proposed by the Administration for FY 1991 -- a decline of nearly 87 percent. Even though Congress, in recent years, has enacted higher levels of operating assistance than proposed by the Administration, these levels still fall far short of the assistance provided a decade ago.

The Southeastern Pennsylvania Transportation Authority (SEPTA), serving the Philadelphia region, has large operating assistance requirements and has also identified billions of dollars in capital investment requirements. During the current fiscal year, the Commonwealth has pledged a total of $318.8 million in combined state operating and capital assistance to SEPTA. Of this amount, $223 million represents state operating assistance, which is nearly three times the amount provided only a decade ago. On the other hand, federal operating assistance for SEPTA has dwindled to $27 million in FY 1990, approximately one-eighth the amount provided by the Commonwealth. Moreover, the Administration proposed the total elimination of federal operating support in FY 1991 for SEPTA and other systems serving a population of one million or more. Given this situation, it will be extremely difficult to finance needed transit capital improvements from current federal, state and local sources. The experience with federal support for rural public transportation over the past decade has been equally discouraging. In spite of increasing state financial support, the decline in federal funding for Pennsylvania through UMTA's Section 18 Program from $4.8 million in FY 1981 to $3.5 million in FY 1990 has presented a tremendous challenge in maintaining public transportation for our rural residents.

These trends in transit funding are not unique to Pennsylvania. The critical importance of reestablishing a strong federal role in the transit mode cannot be overstated. Finally, with a balance of nearly $7 billion in the Mass Transit Account of the Highway Trust Fund, it is clear the federal government could play a larger financial role in the federal/state/local transit partnership without an increase in taxes or user fees. In fact, this dedicated tax for transit is ineffective if it is not released for the purposes for which it is intended, rather than being held for deficit reduction purposes. Pennsylvania has been and will remain a strong partner in financing transit needs, but it is equally important that the federal government fulfill its part of the partnership.

I believe that public transportation must assume a larger role in the future as we strive to balance the demands of an increasingly mobile society against environmental concerns, unpredictable fuel supplies and limited rights-of-way to support the continuation of individual automobile travel at only slightly more than one person per vehicle on average. The public has demonstrated that it will endure relatively high levels of inconvenience and cost before diverting to higher occupancy modes of travel. Therefore, strong incentives will be required to attract individual auto occupants to public transportation. Frequent, reliable, safe and affordable public

transportation cannot be achieved without the federal government as a strong and consistent partner. It is essential that the steady decline in federal financial support for transit be reversed so that we can collectively plan, design and implement effective and efficient transportation systems for the future.

Clearly, there are large transportation improvement needs throughout the Nation and there will never be enough resources to address them all. This makes it very important to use available resources wisely and to make full use of all available transportation funds. Accordingly, I urge Congress and the Administration to draw down the transportation trust fund balances and to increase the level of federal support for transportation programs. The trust fund balances, dedicated taxes which presently total nearly $18 billion, are dedicated to highway and transit purposes. However, these funds are being held to offset the federal budget deficit on paper, a policy which I believe is unfair to the American people who have every right to expect a full return on the transportation user taxes and fees they have paid. Recently, U.S. Department of Transportation officials have indicated that by drawing down the trust fund balances over the next several years, the level of federal funding for the federal-aid highway and bridge program could be increased from the present $13 billion per year to an $18-20 billion per year range and that annual transit funding could

be increased from the present $3.1 billion to $4.5 billion. I support these higher funding levels and assure you that Pennsylvania, as in the past, will have projects ready to utilize any additional federal funding which may be made available. I am proud to say that during my tenure as Secretary of Transportation, we have avoided lapsing federal funds and that we have aggressively and successfully pursued opportunities to increase federal funding through the various discretionary funding programs. As mentioned previously, discretionary and other special federal funding has added more than $797 million to our program over the last four years.

While I applaud proposals to spend all available federal transportation revenues, at the same time, I am concerned with the Administration's plan to lower the federal matching ratios on federal highway and transit projects. This would force the use of higher percentages of state and local revenues to match federal dollars, and would require that we revamp the financial plan for our transportation improvement programs. While large states like Pennsylvania have some latitude in changing the mix of federal/state/local funding in their programs, I expect that a decrease in the federal share would have a devastating effect on some small states. It seems ironic to me that the federal government would consider reducing its funding share

while sitting on large balances in the Transportation Trust Funds.

Dedicated user financing has been and must continue to be the hallmark of federal surface transportation programs. I oppose any increase in the motor fuels tax for deficit reduction purposes or for any other non-transportation purposes. Although reducing the federal budget deficit is a definite national priority, the importance of transportation infrastructure to the nation's well-being is likewise very clear. Also, in the interest of equity, I believe that certain federal tax exemptions such as the current lower tax rate for gasohol should be eliminated, especially in light of the mandated alternative fuel provisions in pending federal clean air legislation.

Construction of the Interstate System has dominated the federal-aid highway program for more than thirty years. Although the System is nearly completed, there are additional federal funding requirements for Interstate Construction that must be addressed in the next surface transportation bill. This is because there are still a few segments of the System to be placed under construction throughout the Nation and because Pennsylvania and other states have utilized the "advance construction" provision to place projects under construction before federal funds are actually apportioned to cover the federal share of project

costs. In Pennsylvania's case, we have $275 million in advance construction projects yet to be converted to regular federal-aid funding. I've heard reports that nationwide an additional authorization in the range of $7 billion is needed to complete the Interstate System. This is of critical importance since the states have proceeded to construct the Interstate System with the assurance that federal funding would eventually be available to cover the full federal share of project costs.

Also, in Pennsylvania's case, there is a unique requirement for Interstate Construction funds which must be addressed. The Surface Transportation Assistance Act of 1982 designated a portion of the existing Pennsylvania Turnpike in eastern Pennsylvania as Interstate Route 95 and referred to a yet-to-be-built interchange between the Turnpike and existing I-95 to provide for a continuous Interstate route from New Jersey through Pennsylvania. In assessing this mandate, we have determined that the cost for building the new interchange, widening the existing Turnpike and building a parallel structure across the Delaware River into New Jersey to accommodate the additional anticipated traffic will be more than $500 million. I believe that the full 90 percent federal share normally provided for Interstate Construction projects should be made available to cover the implementation of this federal mandate. Furthermore, since this is a mandate, the Pennsylvania

Turnpike Commission should not be required to remove tolls on the portion of its facility which is ultimately signed as I-95.

I believe that transportation system preservation must remain a high priority for the future. Past philosophy centered on building more and building better, but we must realize that the primary task now is to preserve and enhance the transportation network we have in place. Our transportation infrastructure cannot be taken for granted; it needs constant attention. We must build upon the almost completed Interstate Highway System to ensure continued economic vitality for the nation. Segments of this network have exceeded or are nearing their design life and require major rehabilitation or reconstruction. In Pennsylvania, we have averaged approximately $125 million per year over the last four years to restore and preserve our Interstate System. Moreover, we need an expanded and more flexible 4R-type program which extends beyond the Interstate System to include those highways which have similar standards and functions as the Interstates. Perhaps a major funding category focused on so-called Highways of National Significance is the answer, but in any event, it is absolutely essential that resources be made available for these Interstate look-alikes.

As urban and suburban congestion become the pressing issue of the day, it becomes clearer than ever that highway solutions are not the only alternative. States are in the best position to pursue congestion relief initiatives in urban and suburban areas and to coordinate transportation priorities through multi-modal planning and applying techniques such as transportation demand management. We can not look to build our way out of congestion in urban and suburban areas as the solution. Changes in thinking as well as behavior modification will be necessary. Expanding and coordinating the role of transit to link with the existing highway network, not compete with it, is an achievable objective. The American habit of one person traveling alone in an automobile just must stop. Ramp metering, high occupancy vehicle lanes, park and ride lots, and car and van pools will also help in meeting our goal to maximize the efficient movement of people and goods. Parking strategies, staggered work hours and a wide range of incentives which can impact the demand for transportation facilities must be explored and selectively implemented to release us from the potential strangle hold of congestion. Federal transportation programs should include financial incentives for states to pursue innovative congestion relief measures.

We have begun planning for an innovative model 21st century urban transportation corridor on Interstate 95 in the Philadelphia area. This initiative will emphasize

improvements which reduce congestion, enhance intermodal connectivity, improve safety, minimize transportation-related air and noise pollution and showcase advanced transportation technologies. Priority will be given to the movement of people rather than the movement of vehicles. I believe that an efficient and mobile transportation network will be achieved only through intermodal activities such as those proposed for the I-95 corridor. Better coordination and integration of the various transportation modes along with the application of the latest available technology can serve to make our transportation system more productive. The new surface transportation program should make federal funding available for innovative intermodal programs such as this which are presently difficult to implement due to categorical funding restrictions. The FHWA and UMTA Administrators have expressed interest in this concept during discussions we have initiated with them.

Safety in all modes is an ongoing commitment on the part of all the participants in the federal/state/local transportation partnership. It must be the cornerstone of the future surface transportation program. Pennsylvania is a recognized safety leader by virtue of its innovative Corridor Safety Initiative which has been hailed as a national model. The Corridor Safety Initiative is a comprehensive approach that integrates highway, driver

performance, vehicle, enforcement and emergency medical service elements to improve safety along 55 of our major corridors which have had severe accident problems throughout the years. This program has been recognized by the FHWA with the Administrator's Safety Award for Innovation, and by the American Association of State Highway and Transportation Officials with its Highway Traffic Safety Award.

The American Association of State Highway and Transportation Officials has prepared a "Highway Safety Strategic Plan for 1991-2000" which contains ten recommended areas for action: safe driving performance; improved pedestrian safety; corridor safety improvements; improved highway safety; enhanced vehicle safety; safe commercial motor vehicle operations; vehicle crash avoidance; enhanced rural emergency medical services; strategic research for safety; and safety management. Careful consideration should be given to including these components in the surface transportation reauthorization legislation and to providing resources to enable effective implementation of a national safety initiative that would lead to substantial reduction in serious driver performance failures and associated highway accidents and fatalities.

In terms of program changes I would recommend, the most basic would be to allow more flexibility in federal transportation programs. The proven track record of the

38-253 O—91——93

states merits less stringent federal requirements, guidelines and mandates in both the highway and transit programs. Reducing the dozens of current federal funding categories and permitting transfers among the remaining consolidated categories would enable states to make full and effective use of limited resources while simplifying administrative details as well. Also, funding sanctions to force state actions are counterproductive and should be eliminated.

While the concept of an "Highways of National Significance" (HNS) system as the primary focus for the future federal highway program is a rational one, it is difficult for me to support it without knowing the related program details. I am concerned about the current approach to a system of HNS. The FHWA, in response to a request by this Committee, is presently asking the states to identify preliminary HNS networks based on those highways which serve 35% and 40% of vehicle miles of travel. This seems arbitrary to me, particularly since the relationship of the size of the HNS to funding and other program details is not at all clear. In Pennsylvania, the target for the "40 percent HNS System" is 4,885 miles out of a total state-owned network of 41,000 miles and a total public road network of approximately 116,000 miles. This makes the selection of an HNS system extremely difficult. Fortunately, the FHWA has allowed an additional alternative

which will permit the states to identify an HNS network based on relevant criteria without regard to mileage targets. I believe that this alternative approach will result in the most logical network. Furthermore, I understand that the FHWA is considering a proposal to target up to 70% of total highway funding to the HNS system, without an option to transfer between other categories or systems. I oppose such a rigid delineation of program funding, since it is contradictory to the principle of flexibility in federal funding which I spoke of previously.

The Federal Highway Administration's proposal to include pavement, bridge, congestion and safety management systems in the surface transportation reauthorization is a good suggestion, and many of the states already have some form of such management and decision support systems in place. However, mandating the states to develop these systems as a precondition to federal aid causes me some concern. States remain the best judge of their own particular situations and the most appropriate solutions, and should be allowed to target funds where they are most needed and provide the greatest benefit without undue oversight from federal authorities. I also believe that innovative financing techniques are necessary to supplement traditional revenue sources. In particular, I favor relaxation of the present federal restrictions on toll financing so that tolling can be applied with more latitude.

Earlier, I mentioned Pennsylvania's specific toll financing initiatives, which I am confident will demonstrate the feasibility of broadening the use of toll financing.

Turning to another key issue for the next surface transportation act, I would like to see a more needs-based allocation of federal funds among the states. Fair and equitable apportionment formulas must be devised to reflect current conditions. The effects of truck traffic on pavement and bridge conditions and overall bridge replacement and rehabilitation needs are two factors which I believe need to be emphasized in any new formulas. For example, the present apportionment formula for federal Interstate Restoration funds is based on Interstate lane-miles and vehicle miles of travel and does not take into account the effects of heavy truck traffic which occasion a large portion of the pavement restoration requirements in Pennsylvania, nor does it take in account the restoration and rehabilitation requirements on Pennsylvania's bridges. As a result, Pennsylvania receives only about 2.5% of the total funds apportioned nationwide for Interstate restoration, compared to 4-5% or more in other major federal funding categories. This makes it extremely difficult for Pennsylvania to continue our massive Interstate restoration program which has reduced the overall improvement needs by 18 percent since 1987. To keep our Interstate restoration program going, we have used

federal-aid primary funds and state maintenance funds for repairs to Interstate highways.

Speaking of the effects of truck traffic on pavement and bridge conditions, I am convinced that trucks are not currently paying their fair share of maintaining the Nation's roads compared to the damage they cause. A more equitable way of allocating highway costs among users of the system is needed at both the federal and state levels. In a related issue, I am very concerned with proposals to allow larger and heavier trucks, especially on roads in states like Pennsylvania with topographic and geometric limitations. My concern for truck size and weight is in three basic areas -- safety, pavement and bridge damage and modal competition. In my mind there is no compelling reason to change the existing truck size and weight limits in view of the potential negative impacts in each of the above areas. Much more research is needed in truck size and weight issues before any changes in current limits are legislated.

Although there are many difficult issues that must be addressed in developing new surface transportation legislation, I want to emphasize the very positive impacts that transportation programs have had and will continue to have on the Nation's economic and social health. The condition and performance of our transportation

infrastructure is directly linked to economic development and to national and international competitiveness, since the ability to move people, goods and services quickly and efficiently is key to economic health and vitality in today's fast paced world. Right here in Altoona, Route 220 demonstrates the positive business, employment and tourism impacts investing in our transportation network can have, not only for the community but the state and nation as well.

However, money and new construction will not necessarily solve every transportation issue. As we move toward the 21st century, we must find ways to make our transportation systems work smarter and work better. We must be willing to invest in research and development to produce the advanced technology that is needed to ensure that our previous investments are protected. The federal government has been a leader in transportation research and development, and I urge a continued federal leadership role in this critical area. The transportation programs of the future just simply can't be "business as usual."

To summarize, transportation has and will continue to be a key determinant of this country's economic and social progress. We must continue to strengthen the existing federal/state/local partnership while also forging new partnerships between the public and private sectors. We must be innovative and persistent in finding better ways to

do things. And, above all, we must be steadfast in our resolve to use all resources available for transportation programs to the best possible advantage.

In my view, the key features of future federal programs which are required to address the transportation challenges of the coming decades include:

- flexibility in the use of federal funds
- continuation of dedicated user financing
- full use of available federal transportation revenues
- equitable distribution of funds among the states
- emphasis on national issues: system completion and preservation, safety and congestion relief
- reduced federal oversight

I offer my full support in any way to the Committee as you proceed to craft the new surface transportation bill. I would hope that your work could be completed and that new legislation is in place when the present Act expires at the end of FY 1991. This timing is important to avoid disruptions in state transportation programs. In any event, I am confident that you will develop strategies and programs for the future which will lead America boldly into the 21st century.

Thank you for inviting me here today to share my views on the reauthorization of the Post-Interstate Surface Transportation Programs. I would be pleased to respond to any questions you may have.

Sub-Committee on Surface Transportation

Committee on Public Works and Transportation
Altoona, PA

September 17, 1990

The start of a new decade marks a time of new direction. This nation's transportation policy is on the verge of monumental change, and so each state must reassess its role in the context of the federal government's move to modify its role in the highway program. I am pleased to present testimony on the future of our transportation network to the Sub-Committee on Surface Transportation, Committee on Public Works and Transportation, on behalf of my district and the Commonwealth.

The 30th Senatorial District, and the state as a whole, has undergone a number of economic transitions in the past ten years. A major contribution to this positive growth and development is our modern highway system. Through the leadership of Congressman Bud Shuster, we have been able secure the federal dollars necessary to complete Route 220 North and South, a four-lane limited access highway linking Altoona to the Turnpike. We look forward to pursuing the next stage of this project, linking 220 North to Route 80, further expanding our connection with new markets.

In addition, we have made substantial progress on the Route 22 project, an important east-west artery linking Harrisburg to Blair County. We will continue to work with the federal government to secure the funds necessary to upgrade this highway.

The continued availability of federal funds has given Pennsylvania a strong incentive to commit a substantial amount of state dollars to our transportation system. In 1989 alone we witnessed an investment of $3 billion in state and federal funds, a strong indication that this partnership works. We have a very

good track record in securing and using federal funds, primarily because we have not gone to the well until we have done our homework. We know what we need and why we need it before we knock at your door.

As we enter the 1990's, it is apparent that our transportation policies, like those of the federal government, will have to be restructured. The Commonwealth's interstate system is near completion. Connector routes must become the priority of the 1990's.

Every rural economic development plan set forth in the state has emphasized the importance of transportation routes and infrastructure. If our rural communities are going to be in a position to attract business and industry, their transportation networks must be safe and convenient. Route 522, a major north-south stretch, connects McConnellsburg and Mt. Union. When planned improvements are completed, this connector route will spur economic development activities in Huntingdon and Fulton Counties.

We must also consider the fact that the trucking industry in this state has far exceeded any transportation experts' expectations. In some areas of the state 35 to 40 percent of the traffic are trucks. We need a sufficient number of connector routes to expedite the transport of raw materials and finished products in and out of more rural parts of the state.

Pennsylvania wants to see the same level of financial support continue to flow from the federal government, but we are

not blind to factors that may affect this commitment. I believe it is incumbent upon leaders in Harrisburg to ensure sufficient funds are set aside to meet growing transportation needs, particularly those involving maintenance and restoration.

The state and my district have witnessed major improvements as a result of a shared state-federal commitment to highway construction and maintenance. The federal government must continue its support in this area to encourage continued economic growth and development.

Most important, from a state perspective, we hope that Congress can pass the Surface Transportation Act without tying in any amendments that would hold back any portion of the state's transportation funds, keeping intact the standard procedure involving customary matches.

SENT BY:LEG DEVELOP/M KEENAN ; 9-14-90 ; 5:02PM ; 7177723630→ 2022252431;# 2

STATEMENT OF

REPRESENTATIVE ALLEN G. KUKOVICH, CHAIRMAN

MAJORITY POLICY COMMITTEE

PENNSYLVANIA HOUSE OF REPRESENTATIVES

Before the

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

UNITED STATES HOUSE OF REPRESENTATIVES

SEPTEMBER 17, 1990

The Federal Government, in partnership with the states, has constructed an interstate highway system that effectively links the major metropolitan areas of the continental United States. However, that same partnership has not effectively created a funding mechanism to absorb the high maintenance costs that occur each year as the system continues to age.

In addition to a growing inventory of maintenance needs new highway construction costs present fiscal dilemmas that can not be adequately met by traditional sources of revenue.

In February of this year the Department of Transportation pronounced the national transportation policy in a publication entitled "Moving America". It stated that strategies for action were needed in a number of different areas. One area cited was the need to "institute user fees to recover costs from users of federally funded or federally provided transportation facilities and services who are not now paying user fees". There is a rational progression from this federal transportation policy point to a legislative goal listed in Chapter IV of "Moving America" which calls for allowing greater use of toll financing on Federal-aid highways.

If tolls would be instituted on Interstate 80 in Pennsylvania, with no federal aid repayment, 92 million dollars would be generated annually assuming passenger car

rates of 3.7 cents per mile and higher toll rates for trucks. The additional revenue source could solve the I-80 maintenance funding dilemma as well as provide a predictable revenue source for construction costs of proposed limited access highways in Pennsylvania. I believe the institution of user charges or tolls on multi-regional interstate highways are necessary if we are to achieve the highway infrastructure goals stated in the national transportation policy. This additional revenue would enable the states to perform the necessary reconstruction and maintenance of aged interstate highways as well as provide a predictable source of revenue for new limited access highway construction.

Mr. Chairman, my name is Alfred F. Lyng. I am Chairman of the Pennsylvania Highway Users Conference. I regret that I was unable to attend today's hearings but the logistics of getting to Altona were just too great, especially on a Monday morning.

The Conference views these hearings as vital in the process of getting a new Surface Transportation Act. We appreciate your continued dedication to transportation, and we join with you in an all-out effort to get a new Act, and get it before the October 1991 deadline.

It may seem to some that the era of the auto and bus are over. That roads and bridges are a need of the past, but you only have to look at your local or metro newspaper to see that the public and the media are greatly concerned with the condition of all our systems. Far too often, school buses have to go miles out of their way because of bad bridge conditions. While bridges are a main worry of many citizens, the condition of the roads and highways is also of great interest to the motorist, because bad roads cost money in lost fuel mileage, tire replacement or repair and as a safety hazard.

We shudder to think that Gramm, Rudman, Hollings could still take some $ 3 billion from the Trust Fund, this year, unless Congress takes the proper action. Let's face it, the highway and bridge needs are too critical to take a

hit like this. Further, we have always felt that the Highway rust Fund should not be part of the federal deficit and should be taken off budget.

For some time now the Conference members have felt that the Highway Trust Fund should be drawn down. The surplus today is more than $17 billion. Not making this surplus available to the states has mean't that many vital road and bridge projects have been delayed or postponed indefinitely. We have fought, for two years, the idea that a gasoline tax increase should be used for budget reduction. We also believe that the gasohol exemption should be phased out as soon as possible. The proposals to use more gasohol makes it imperative that this Trust Fund loss not continue.

We are an affiliate member of the Highway Users Federation, and we support their nine-point program designed to fit into a new Surface Transportation Act. There are users who feel we may need an increase in user taxes, but we couldn't support such an effort until the surplus in the Trust Fund is drawn down.

The need for all highway user taxes to go for transportation has never been greater. With the call for alternative fuels must come a new method of determining how such use can be measured for inclusion in the Highway Trust Fund. To lose additional user taxes would put many state and federal transportation projects in jeopardy. it must not happen.

As a key member of the Public Works and

Transportation Committee you recognize the problem we will probably have getting the other members of Congress to make the new Act a top priority. We look forward to working with you in getting the new Act and getting it on time.

In closing, I invite you to attend the Highway Transportation Futures Congress, sponsored by the Highway Users Federation to be held in Washington July 14-16 next year. We will be there in numbers focusing on the goal of a new Act. Our members are planning on visiting their Congressional delegation and helping to put in focus the need for a new Act.

Thank you Mr. Chairman for holding these hearings, and for the opportunity to testify before your Committee.

Alfred J. Luzy, P.E.

LOGAN TOWNSHIP / BOARD OF SUPERVISORS
800 39TH STREET, ALTOONA, PA. 16602

September 17, 1990

GENTLEMEN:

LOGAN TOWNSHIP WISHES TO REAFFIRM ITS CONTINUING COMMITMENT TO THE PROPOSED HIGHWAYS, THAT BEING THE FOUR LANE LIMITED ACCESS FROM CHESTNUT AVENUE AND FOURTH STREET, ALTOONA TO THE NEW PINECROFT INTERCHANGE AT RTE. 220.

ALSO, WE WISH TO REITERATE OUR ONGOING COMMITMENT TO THE ROSEWELL STREET BRIDGE PROJECT LOCATED IN LAKEMONT, LOGAN TOWNSHIP.

WE FURTHER SUPPORT ANY OTHER ROADS WITHIN THE TOWNSHIP, OR AREA, WHICH WERE PREVIOUSLY MENTIONED WITHIN THE TWELVE YEAR PLAN.

The Chamber
Altoona-Blair County
Chamber of Commerce
1212 Twelfth Avenue Uptown
Altoona, PA 16601-3393
Celebrating 100 Years of Service

April 23, 1990

Ms. Rose Lucey
Blair County Planning Commission
Blair County Courthouse
Hollidaysburg, Pennsylvania 16648

Dear Ms. Lucey:

As recommended by the Transportation Committee of the Altoona - Blair County Chamber of Commerce at their meeting on Wednesday, April 18, 1990, the following is a list of our priorities relative to the Twelve Year Highway Planning Process:

Capital Improvements

1. William Penn Highway - Pittsburgh To Cuba Mills (First Four Years - Design, Right Of Way And Construction)
2. PA Route 764 - Cross Keys to Duncansville (First Four Years - Construction)
3. Airport Access - Leamersville To Route 164 Turn Off For Martinsburg On Route 36 In Roaring Spring (Approach Funding With Possible In-Kind Contributions)
4. Ninth Avenue (PA Route 764) - 31st Street To Lloyd Street (On 12 Year Plan - Enterprise Zone Match)
5. SR4008 - Horseshoe Curve Road From Altoona's 40th Street/Broad Avenue To Gallitzin Interchange At Route 22 (On 12 Year Plan - AIHP Match)

Major Concerns

1. Appalachian Thruway - 17th Street To Grazierville (First Four Years - Construction)
2. Appalachian Thruway - Bald Eagle In Blair County To Martha Furnace In Centre County (First Four Years - Design And Engineering, Second Four Years - Right Of Way And Construction)
3. Chestnut Avenue - 4th Street To Pinecroft Interchange (On 12 Year Plan)

Mass Transit

1. Support Of High Speed Rail Initiative From Pittsburgh To Philadelphia (On 12 Year Plan)

Sincerely,

Theodore D. McDowell

Senator Bob Jubelirer

TESTIMONY PRESENTED TO THE PENNSYLVANIA TRANSPORTATION COMMISSION AT THE PUBLIC HEARING IN ALTOONA, APRIL 6, 1989 REGARDING THE TWELVE YEAR HIGHWAY AND BRIDGE PROGRAM ON BEHALF OF THE ALTOONA - BLAIR COUNTY CHAMBER OF COMMERCE BY JERALD L. SACKS, DIVISION VICE PRESIDENT FOR TRANSPORTATION/GOVERNMENTAL AFFAIRS.

The Altoona - Blair County Chamber of Commerce, representing the business voice of its 800 members in various Blair County communities wishes to thank the Commission members for their support in the past. We've continually been in the forefront for transportation improvements, knowing the economic opportunities which avail themselves from our support. After years of promises, the work that has finally been completed and that which is heading toward construction has been of major economic impact to the Altoona/Blair County area. It may soon connect us with the outside world. Much additional work is necessary before the highway network in the area may be considered adequate. With this in mind, may we outline those items our Chamber identifies as vital for the Twelve Year Program.

First, four vitally important projects are currently programmed.

ONE: U.S. Route 220 from 17th Street to the Tyrone Bypass must be constructed. Because of the time provisions on the federal funding match we need to accelerate the construction phase so as not to lose this opportunity for completion.

TWO: We applaud the vision of the Department on the inclusion of various needed improvements programmed presently for U.S. Route 22 West from Ebensburg to Pittsburgh. We urge the Commission and the Legislature to maintain their focus on these projects. This route is important to Blair County as it will open Central Pennsylvania to the Pittsburgh market place, Pennsylvania's second largest city.

THREE: U.S. Route 22 East Planning Study (March 1989) is now completed and recently released. Let's immediately use the findings of this comprehensive document. We concur with its recommendations and specifically request that funding for engineering design and right of way be placed in the second four years, with construction programmed for the third four years. We support the five major improvements of the study: the Hollidaysburg Bypass, Short Mountain, Water Street, Lewistown Bypass and the Lewistown Narrows to Cuba Mills projects. This route is vital to Blair County as it will open Central Pennsylvania to the Harrisburg market. Both our number two and three priorities are consistent with the broad base support of the William Penn Highway Association and the America's Industrial Heritage Project.

FOUR: PA Route 764 from Cross Keys, the U.S. 22/220 Interchange to Duncansville must be built. This project has been moved about within the program during past years and it must be restored permanently to its position in the first four years for immediate construction.

Secondly, we wish to address new projects identified by our Chamber which need initial inclusion on the Twelve Year Program.

ONE: U.S. Route 220 must be extended northward from the Tyrone Bypass at Bald Eagle to the Blair/~~Centre Co.~~ line. Logically, this highway will then be completed through the entire Blair County region. Specifically, we recommend a location study be placed in the first four years, engineering design and right of way in the second four years and construction in the third four years. This position is consistent with the Applachian Thruway Association's goals.

TWO: The Chamber sees difficult and unreliable airport access, traffic congestion, safety concerns and the opportunity to open economic development to the southern portion of Blair County as reasons to request inclusion of highway improvements from the Leamersville Interchange, U.S. Route 220 and PA Routes 36/164 East to the Altoona - Blair County Airport, PA Route 866. The program should reflect studies, design and right of way in the first four years, and construction in the second four years.

THREE: Altoona needs the ability to develop its northern portion of the city. We concur and support the City of Altoona in its effort to have Chestnut Avenue from 4th Street in the city

extended completely to the Pinecroft Interchange of U.S. Route 220. This project needs to be positioned on the Twelve Year Program and phased so that design work may be initiated immediately.

FOUR: Again, transportation system improvements in the City of Altoona are of concern with the next project, Ninth Avenue from 31st Street to Lloyd Street. This project area encompasses the city's entire Enterprise Development Zone, with Ninth Avenue having been identified as the primary corridor for retention and expansion of industry and attraction of new industry by making land more accessible and new development parcels available. At the same time it would relieve traffic congestion and improve safety in the Altoona Area School District Campus by relocating the PA Route 764 corridor. This total corridor needs placement on the Twelve Year Program to ensure that design work be started at once.

We also have reviewed the bridge improvements part of the proposed Twelve Year Program and recommend expediency for those projects identified for the first four years.

A summary of the recommendations of our Chamber of Commerce is attached as part of the testimony.

Lastly, the Altoona - Blair County Chamber of Commerce has supported and recently reaffirmed its support that the Administration and Legislature take immediate positive action to offer an enhanced revenue program for highway construction via an increased fuel tax.

Thank you, once again, on behalf of the Altoona - Blair County Chamber of Commerce, for allowing our organization to express priorities on this subject so vital to our area.

For the Record

WHEREAS the use of double tractor trailers has increased in Pennsylvania over the past few years; and

WHEREAS there is now pending before the U.S. Congress a bill which would require Pennsylvania to allow triple tractor trailers on our highways; and

WHEREAS the safety factors involved in the operation of these triple vehicles has not been ascertained

NOW THEREFORE the Pennsylvania State Coroners Association urges the defeat of any federal legislation that would require Pennsylvania to allow triple tractor trailers on our highways until it has been determined that they can be operated safely

The above resolution was adopted by the PA State Coroners Association at it's annual conference in Altoona, PA on September 15, 1990

Secretary

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

MONDAY, SEPTEMBER 17, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Ebensburg, PA.

The Committee met, pursuant to call, at 11:00 a.m., in the Ebensburg Municipal Building, 300 West High Street, Ebensburg, Pennsylvania, Hon. Norman Mineta (Chairman of the Subcommittee) presiding.

Present: Representatives Mineta, Murtha, Hammerschmidt, Roe, Clinger, Shuster, McEwen, Packard, Lightfoot, Hastert and Hancock.

Mr. MINETA. The Subcommittee on Surface Transportation of the U.S. House of Representatives Committee on Public Works and Transportation will please come to order.

Before we proceed into the main part of the Subcommittee's business, I do want to take the time to make several observations.

First of all, we are holding these hearings here in Ebensburg, Pennsylvania in view of the major transportation role that is played by your own member of Congress from the 12th District, Congressman Jack Murtha. Now, as many of you know, there are—we have a two-track system. We authorize things to be done in law; and once we authorize it to be done, then the monies have to be appropriated for that purpose. And so, your member of Congress, Jack Murtha, is a very, very important member of that appropriation process. You know him as the Chair of the Defense Appropriation Subcommittee. We know him as the person we can go to in order to say, "These are our issues on Public Works and Transportation, and Jack, we need your help." And Jack has always been responsive. He is the kind of behind the scenes worker who really knows the kinds of needs—not only here in the 12th Congressional District of Pennsylvania, where he has been able to significantly increase the amount of funding for transportation projects that you need in this area—but more importantly, for the money that this great country of ours needs for transportation infrastructure.

And so, it is especially because of his work in this regard that we are here at his invitation to come and see other facets of the transportation infrastructure that we ought to be dealing with because we ought to have not only a balance in terms of transportation modes, but of looking at the transportation needs of the differing regions of our great country.

Now, I know how proud you are of Jack Murtha. But as a colleague of his, I know that I can personally vouch of how tirelessly Jack works in Washington, DC to improve the well-being of the 12th Congressional District. I know that I can count on Jack Murtha during these next 13 months as we attempt to craft the new legislation dealing with the National Transportation Assistance Programs as we try to deal with transportation issues for the balance of the 1990s and as we prepare for the 21st century.

Let me also thank today's witnesses in advance for their testimony. I apologize for having to shorten the time period today. But we, unfortunately, are being faced with a number of votes in Washington, DC, and so, we have had to sort of contract today's schedule in order to get back in time for those votes.

And I also want to thank very much the Ebensburg local officials for our—for the use of this fine facility here in Ebensburg. Again, to you, Jack Murtha, thank you so much for inviting the Subcommittee to visit Ebensburg and Pennsylvania's 12th Congressional District.

Now, I would like to, at this time, yield to my very fine colleague, the ranking Republican on the Subcommittee on Surface Transportation, the very distinguished member from the 9th Congressional District here in Pennsylvania, Bud Shuster. Bud.

Mr. SHUSTER. Thank you very much, Mr. Chairman. We are here today because of Jack Murtha. Not only because of our tremendous respect for Jack Murtha; but also because of the tremendous leadership which Jack provides in the Congress. And I can tell you, in the 18 years that we have served together and I have gone to Jack time and time again to enlist his support on important projects, never—never once has there ever been a question of, "Is it Republican?" or "Is it Democrat?" The question has always been, "Is it good for Pennsylvania?" "Is it good for the nation?" And, we have worked together on a bipartisan basis. And in fact, I think there is probably a little extra plus to the fact that this region of Pennsylvania is represented by both Republicans and Democrats. And so, we are here because of Jack Murtha and we are looking forward to the testimony today. Thank you.

Mr. MINETA. Mr. Roe.

Mr. ROE. Thank you, Mr. Chairman. I want to echo the same sentiments that have been echoed by yourself and the distinguished gentleman from Pennsylvania. Now, I came here not only to participate, with Jack Murtha, in what is happening in Pennsylvania; but I observed something, and I want to share with the people of this great state that there are four distinguished members in the House of Representatives, here that are on the Public Works Committee. And I find that being our close relationship—New Jersey, my state, being next door—it is very important to know the people that are on the authorizing committee. Particularly here, Bud Shuster, our distinguished ranking member and Bill Clinger.

But also to you. I want to thank you publicly. I know there are members of your legislature here because you have been extremely helpful, not only to the state of New Jersey, but as Chairman of the Science, Space, and Technology Committee—and they would say, "Well, what has that got to do with roads?" There may be the roads of the future, and they will be. I want to thank you from our

Committee's point of view for the extraordinary effort and energy you put forth and the resources you have provided for the Science, Space, and Technology Committee programs of this nation. I want to thank you publicly for your help in that direction.

Thank you, Mr. Chairman.

Mr. MINETA. We have with us the ranking Republican on the full Committee on Public Works and Transportation. A person I have had the joy of working with when he was the ranking Republican on the Surface—or on the Aviation Subcommittee that I chaired for eight years. And in four of those years, Congressman Hammerschmidt from Arkansas was my ranking Republican. There is not a finer gentleman in the House of Representatives or better teacher. But, I would like to introduce at this time the ranking Republican on the full Committee on Public Works and Transportation, Congressman John Paul Hammerschmidt of Arkansas.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman. Thank you for holding these hearings at the request of our good friend, Jack Murtha, a fine colleague in the Congress.

You know, I know I join all the members of this panel when we say we are delighted to be here in the 12th District to explore the highway and transit issues that affect the people who live in this beautiful central Pennsylvania area. So Jack, thank you for hosting the members of our Committee that are here today.

You know, Jack has served this district well in Congress for almost 18 years. He served for 15 years, as has been said earlier on the powerful Appropriations Committee. And just last year, became Chairman of the House Appropriations Defense Subcommittee—indeed, a very powerful position. In addition to his significant duties overseeing all military spending, he has been very instrumental in achieving funding for various highway projects in this area, including the Ebensburg Bypass, Route 22, new interchanges on Route 219, Route 56 and the airport access road to the Johnstown Airport. Clearly, he recognizes the importance of a strong highway infrastructure to this area's economic development and strength.

So, I am delighted to be here, and I look forward to hearing from our witnesses.

Mr. MINETA. Congressman Clinger.

Mr. CLINGER. Thank you very much, Mr. Chairman. And, I join with all the others in saying how delighted we are to be here with our good friend, Jack Murtha. You know, some months ago, I was honored to be here when we broke ground for the Ebensburg Bypass, and that project would not have happened without Jack Murtha. That is symbolic of the kind of thing he has been able to accomplish in this district and, indeed, throughout Pennsylvania. Jack Murtha recognizes that a good highway system is essential for rural areas. And where we are going to be groping with that over the next year or so to try and come up with a bill that is going to recognize and add to the highway network in this country. And, I have worked very closely with Jack Murtha and followed his lead in working on Route 219, which I think can be a major highway, opening up our trade with Canada, would be complementary to Route 220.

So, I just want to commend you for the fine work that you have done, not just for your district, but for the state and the nation.

Mr. MINETA. The gentleman from Ohio, Congressman McEwen.

Mr. MCEWEN. Thank you, Mr. Chairman. I am fully aware of the limited time that we have available to us; and yet, I have said this privately to our host on more than one occasion. It is only proper that I should say it here. And that is that three members of this Committee, Mr. Roe and Mr. Shuster and myself, have served on the Intelligence Committee. And in recent years, as very difficult decisions have been made as to our nation's security, that in every one of those discussions, we have—the name of Jack Murtha has constantly played in the decision process of other Committee members. He has been a true leader and one that I admire greatly.

The President of the United States, in recent weeks met with the head of the Soviet Union and phone conversations repeatedly with the head of Great Britain and France and Japan and others, was able to make a strategic decision with the support of the United Nations that in three and a half weeks accomplished more than President Truman was able to do in six months in the transportation and military affairs. No small measure of that was made possible because of the leadership of the member of the Appropriations Committee and Defense Subcommittee, Mr. Murtha, over the recent years, and placed the President in a position to have the facilities available to him to make the decisions necessary.

I am delighted to be in the district of one of my political heroes and trust that I can be of some return favor on the Public Works Committee as he has been to our nation by his service on the Defense Appropriations Subcommittee.

Thank you, Mr. Chairman.

Mr. MINETA. Congressman Packard, a very fine colleague of mine from California.

Mr. PACKARD. I will be very brief. I am just delighted to be in your district, Mr. Murtha, and am looking forward to the witnesses that you have arranged for, certainly the information we gather from the witnesses this afternoon and this morning will be very important as we develop the next highway plan for the country.

Mr. MINETA. From the great state of Iowa, a very fine colleague, Mr. Lightfoot.

Mr. LIGHTFOOT. Thank you, Mr. Chairman. Again, as my colleagues have already said, it is a great pleasure to be here this morning, and it is because of Jack that we are in town. And one of the things that I have enjoyed on this Committee is the bipartisan way that we have approached issues over the past. We tend to leave our letter sweaters at the door and look at the problems and what solutions are to those. And one of the things I think that Jack has done for Congress—and possibly it is because of that great Marine Corps heritage—but, he has brought a little semper fi to the U.S. House of Representatives. And by gosh, in these times, we need a whole lot more of that.

Jack, I just appreciate the leadership that you have given us. And particularly, when we are down in the floor and you are up in the chair, we know that it is going to get done and get done quickly and thoroughly. And that is something that we really appreciate. Appreciate your work.

Mr. MINETA. From the state of Illinois, a very fine colleague, Congressman Dennis Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. To reiterate what Bud Shuster said, Jack Murtha, we are here because of you today. And certainly, you are one of the giants in the United States Congress. But, I think beyond that, it is important for this Committee to get out beyond the beltway of Washington and really talk to real people and see what real problems are and try to come up with some good solutions. And in the brevity of time, I am not going to go much farther than that; but, I appreciate your leadership in getting us out here to talk to these great people. Thank you.

Thank you, Mr. Chairman.

Mr. MINETA. Congressman Mel Hancock from Missouri—freshman member, but one who is learning very quickly about the jurisdiction of the Committee on Public Works. Congressman Hancock.

Mr. HANCOCK. Here again, I appreciate, Norm, that you did not introduce me as the oldest member of the freshman class. I mean that is—I keep waiting on that, but he is being a gentleman. Thank you, Mr. Chairman.

I would just like to say that I truly appreciate Jack and Bud's courtesy and hospitality to me and to this entire delegation and of the people of the Commonwealth of Pennsylvania. It has been a very pleasant trip for me to be back up here. I have been in this area one time about 20 years ago, and I have always wanted to come back. I did not know I would be coming back at retirement age as a Congressman, though. Thank you very much.

Mr. MINETA. At this time, I would like to call on a very distinguished friend and colleague, Congressman John P. Murtha. Again, Jack is highly respected in Congress. And Jack, it is great to be here in your community. And if you would go ahead and introduce your colleagues with you.

Mr. MURTHA. We have to my left the Chairman of the County Commissioner's Board, Joe Roberts. We have to the left of him Ron Stevenson, a Democratic member of the Board. And to my right, one of the staunchest members of the County Commissioner's Board, Kathy Holtzman. And, I wanted them to join me in Cambria County, where you are sitting—and of course, we have legislators mainly from Cambria County, but some from Westmoreland County and even Allegheny County—but, to join me to welcome you. And, I will turn to Mr. Roberts to do the formal welcoming.

Mr. ROBERTS. I am very happy and honored to honor such a distinguished crowd. It is the first time, you know, that people around here have seen so many Congressmen all at one time, only on TV. And, I know you are here for a good mission—a mission that we should have had years ago. And, we are very, very proud to welcome you to this area of Pennsylvania.

And right now, I would like to say, starting his tenth term of the United States Representatives, Congressman John B. Murtha has combined his leadership in national legislation areas with a key role in local economic development in the 12th Congressional District to produce a record of legislative and job development accomplishments. Today, he is here to welcome the Committee for the Regional Hearing of the Surface Transportation Subcommittee of Public Works.

Jack Murtha's accomplishment during his tenure in Congress are too many to mention. He was convinced in the area of FAA not to set down to flight service station until a known federal control tower is in place at the Johnstown Cambria County Airport. The FAA will fund the tower at $100,000—$100 million—$100,000 per year for the next five years. He has included language in the fiscal year 1991 to fund Route 56 for $20 million. He has responsible—was responsible for the funding of $13.7 billion to construct the Ebensburg Bypass. He was responsible for the funds appropriated for the airport access road which was just completed. He has received numerous local, state and national honors. I could go on and on. It would take hours. He has helped the Boy Scouts, Girl Scouts and so many others that the list is endless.

So now, I turn this over to Congressman Murtha, one of the best friends of our good Congressman.

Mr. MURTHA. Thank you very much, Joe. Let me again reiterate how much I personally appreciate this distinguished panel coming to Western Pennsylvania. No question in my mind, we have one of the most distinguished groups that you will find throughout the entire nation, representing a wide spectrum of responsibilities. And I know you made a substantial sacrifice to come to this area, and we deeply appreciate it.

I want to commend and compliment the Chairman of this Surface Transportation Subcommittee, Norm Mineta, who came from California especially for this. And Bud Shuster, an old-time friend, the premier surface transportation promoter in all of Pennsylvania and one of the best experts in the entire country. And of course, Bob Roe, Chairman of the Science and Technology Committee, who I work so closely with. John Paul Hammerschmidt from Arkansas, who we have worked so closely together in getting so many things done over the years. A prominent member of so many committees and such responsibility in Congress. Bill Clinger and I, of course, go back a long ways. We have worked hard on trying to extend Route 219, and we have been—had some great success. But, all of you, I want to express my appreciation for your coming to this area.

And then, I just want to mention a couple of items because they are so important. You came down 22. Of course, 22 is the main access into Pittsburgh—a deplorable situation. One of the things that was mentioned in the other hearing was how important it was to transfer now from the interstate highway system and the primary construction to maintenance. The states just have not been able to afford the maintenance—no question about it. This would be a tremendous help to us to broaden 22, to widen it and to have some federal responsibility in that regard. 219—Bill and I will be working on this with the Committee. Hopefully, we will be able to get some sections in there because that, again, is the north/south access. 56, another highway which comes in to Johnstown.

We have been devastated—Bud's area and my area and Bill Clinger's area—by the lack of coal jobs, by the loss of coal jobs, by the loss of steel jobs. The unemployment rate was at one time 24 percent just a few years ago in this very area. And of course, we tried to attract industry. One of the first things they said was, "Where are your highways?" "How can we get in and out?" We have a diversified program for trying to present America's industri-

al heritage, which is a unique nine-county program where we built museums and highlighted the industrial beginnings of this great nation right here in western Pennsylvania. But, you cannot get the people in. Half of the population of the United States is within 500 miles of Johnstown, of Altoona. And, you know, we are working on roads, but we certainly need your help. And I endorse what you are saying about the fact that you should start doing maintenance work and change to building infrastructure and roads and so forth.

And one other thing I want to endorse and I know most of the Committee members feel this way. I do not think, under any circumstance, that we should use tax money from highway funds for reduction of the deficit. I know there are all kinds of rumors, and I just believe it should be dedicated to fixing, repairing and building infrastructure and highways in this country. And it would be a terrible mistake to divert it to any other type funding. And so, as important as the deficit is, I agree with this Subcommittee and this Committee completely that that would be a major mistake to start to divert those funds when there are so many needs in this great nation.

So again, I just want to express my deep appreciation for all of you coming to this area and look forward to hearing the rest of the witnesses, and some of these here will testify later on. Thank you very much.

Mr. MINETA. Thank you very much, Jack. Let me have you join us up here at the panel if you would.

And at this time, I would like to call on the Cambria County state legislators, led by Senator William J. Stewart. Senator Stewart will be accompanied by Representative Andrew Billow, Jr., Representative Edward J. Haluska, Representative Leona G. Telek and Representative John N. Wozniak. Senator Stewart, it is great to have you here with us, and your statement will be made a part of the record. And, if you would go ahead and proceed in your own fashion, sir.

[The prepared statements of Mr. Murtha and Mr. Clinger follow:]

38-253 O—91——94

Opening Statement of
The Honorable William F. Clinger, Jr.
During the Surface Transportation Subcommittee Hearing
on Reauthorization of the Federal Highway
and Mass Transit Programs

Monday, September 17, 1990
Ebensburg, Pennsylvania

Mr. Chairman, highways are literally the economic lifeline for every community in this country. And for most areas, highways are the sole form of transportation, whether for business or personal travel.

But in this day and age, being located next to a 1950's era highway is not good enough. Today industry depends on the efficient movement of goods and materials. If a town or city does not have easy access to an interstate or a good four-lane highway, they are at a severe disadvantage attracting new industry and may, in fact, have difficulty retaining existing industry.

The federal interstate system has provided our country with a network of highways that is the envy of the world. But at the same time, the completion of our interstate system has had the curious effect of segregating our communities between the haves and have-nots. If a rural or urban area is not presently served by an interstate or four-lane highway, its chances of gaining access to this system in the future is severely limited. And without good access, the ability to attract or sustain economic growth is jeopardized.

With that in mind, as our Committee begins to fashion a new highway bill in the post-interstate era, I believe we ought to begin focusing on improving highways in those areas that lack easy access to interstate or four-lane highways, especially if highways represent the only form of transportation. And I believe special attention should be given toward building on the interstate system by strengthening the web of connecting federal-aid highways so that they can improve access to towns and cities removed from the interstate.

Route 219 provides an excellent example of what the future direction of our highway system should be. It is a direct north-south link running between Canada, via Buffalo, New York, through central Pennsylvania, and into western Maryland and West Virginia. If given the necessary improvements, it would prove to be an invaluable trade route between our area of the country and Canada.

For the present though, 219 is largely two lane and is considered too mountainous and narrow to serve as a long-distance route. Most communities lying along 219 are totally reliant on it not only for north-south movements, but they also need to travel 219 in order to eventually connect with major east-west corridors.

Many of these communities clearly fall into the category of the "have-nots" that I alluded to earlier. Their prospects for future growth will be hampered until, and unless, 219 is upgraded.

We have an excellent example here in Pennsylvania of the economic benefits that flow from an upgraded highway system. Our colleague, Rep. Bud Shuster, has been instrumental in directing federal support to Route 220, rebuilding what was once a narrow, twisting two-lane highway into a state-of-the-art four lane system. Industry -- and with it jobs -- are now relocating along 220 to take advantage of its access to interstate 80 and the Turnpike. Bud has set an example of the type of successful highway projects that should be authorized in the new highway bill.

In the same context, an improved Route 219 would supplement the movement of traffic to and from Canada, Interstate 80, the Turnpike, and western Maryland and West Virginia. It would serve as a complement to 220 and would no doubt result in even more industry citing along that corridor.

With that, I want to thank our Chairman, Mr. Anderson, Subcommittee Chairman Mineta, and our hosts and my neighbors, Bud Shuster and John Murtha, for scheduling today's hearings. I look forward to hearing from our witnesses, and I want to thank them for taking time out from their busy schedules to appear before us this morning.

Thank you, Mr. Chairman.

TESTIMONY OF CONGRESSMAN JOHN P. MURTHA

Before the Public Works and Transportation Committee

Subcommittee on Surface Transportation

Regional Hearings at Ebensburg, Pennsylvania

September 17, 1990

TESTIMONY FOR SURFACE TRANSPORTATION SUBCOMMITTEE

Mr. Chairman and Members of the Subcommittee:

I appreciate the opportunity to testify before the Subcommittee on Surface Transportation of the Public Works and Transportation Committee. I would like to thank the Members of the Subcommittee for coming to Ebensburg today to get an up-close look at the transportation situation in our area. The many local officials and private citizens from the area who will testify today will provide details of many of the road projects that are important to the region, and discuss the impact that these projects have for the people and the development of the region.

The legislation which has prompted this hearing, and which will be considered by Congress next year, will re-authorize surface transportation programs. This legislation comes at an important time, as we near completion of the Interstate highway system. The Interstate system has been the focus of federal assistance for highway programs for the past thirty years. It is now time to turn a new page, and decide where next to focus our efforts.

One area of vital importance to much of the nation is the United States highway system and connecting roads. Although the Interstate system has helped to connect one end of our great Nation to the other, as well as serving many points in between, there are still many parts of the Country which are not serviced by Interstate highways. The ever-increasing importance of surface transportation, and the necessity of easy access to improved surface transportation for many businesses, means that areas not served by Interstate highways are at great risk of falling behind economically unless they are able to improve their existing highways.

The Congressional Research Service has estimated that an expenditure of $1 billion on highways and bridge construction will result in a total output of $2.4 billion in the economy. 52,000 people are estimated to gain employment by an expenditure of $1 billion on highway and bridges. For every 1,000 individuals employed directly in highway and bridge construction, another 1,058 would gain employment elsewhere in the economy. Obviously, the construction of highways and bridges is an important boost for the economy of a region in both jobs and increased production.

As you may know, the economy of Central and Western Pennsylvania went through a severe slump in the late 1970s and early 1980s. The region had relied on the coal and steel industries for its livelihood for a century, and the collapse of these industries left our region in desperate shape. Thousands of individuals lost their jobs, and we were in danger of seeing the entire economy of the area fail.

But one of the distinct advantages our region has is the resourcefulness and dedication of our people. We began a massive economic diversification program which has brought many new and exciting job opportunities for the workers in our area. Federal programs have assisted in retraining many of our workers for these new jobs. And we have looked at other ways to boost our economy. An innovative tourism program, America's Industrial Heritage Project, highlights the history of the area, and has increased tourism greatly over the first two years of its existence. Over the Labor Day Weekend, the Johnstown area hosted the American Folklife Festival, which brought thousands of tourists into the area. And planning is still going on for more projects designed to stimulate our economy.

The importance of highways to this economic revitalization cannot be underestimated. One of the first things that manufacturers ask as they investigate our area is the condition of the highways. Manufacturers need access to markets, and the highway infrastructure in an area is a key to their decision whether to locate there. A study by Pennsylvania State University demonstrated that inadequate transportation was the biggest complaint of companies who were investigating location in Central and Western Pennsylvania. We have managed to attract manufacturers to the region in numbers large enough to begin our economic revitalization and diversification. But highways will continue to be critical if we are to continue this effort. In addition, if we are to attract growing numbers of tourists to the area, we must have the roads to handle an increasing number of vehicles.

Another factor which cannot be taken lightly is the potential for recession over the next few years in the U.S. The construction of highways, leading to a economic diversification, is a significant buffer against recession, because of the money which is pumped into the local economy. Although a recession is harmful to all sections of the Nation, it could be particularly devastating to our region, which is just getting back on its feet after our severe problems. Highway construction must play a part in battling the effects of any downturn in the overall economy.

One unique feature of our region is the difficulty of constructing roads because of our mountainous terrain. The Members of the Subcommittee saw some of these difficulties as they went over Cresson Mountain to come to Ebensburg. The dangerous curves and treacherous mountain climbs that we are forced to deal with make driving very difficult for the average motorist in our area. Although we have discussed the economic impact of road construction, we must also stress the safety factor for the people of Central and Western Pennsylvania. Climbing lanes on many of our roads, improvements to increase visibility in bad weather, and the widening of narrow lanes in rural areas are all factors which can increase the safety of travelers on our roads.

A number of projects have been begun in our area which are beginning improvements to the highway system. One of the most important for the overall region is the improvements to U.S. Route 22 from Altoona to Pittsburgh. U.S. Route 22 currently consists of sections of limited access highway interspersed with two lane rural road. U.S. Route 22 is the main route from the northern part of our area to Pittsburgh, and is an important access road for numerous industries and individuals who live along this route. Continued improvements to this route are important for the development of this area.

U.S. Route 219 is a main North-South route in Pennsylvania from the New York to the Maryland line. As with U.S. Route 22, sections of this highway are limited access, while other sections are two-lane highways, going through small towns and mountainous rural areas. U.S. 219 from Somerset to the Maryland line is of particularly importance to the area, because it would provide a connecting route to the South, which would connect with a four-lane limited access highway, U.S. Route 40, providing connections to West Virginia and the Washington, DC area. Plans for improvements to portions of this highway have been approved, but significant sections must continue to be developed. I have discussed this highway with many of you on the Subcommittee, and I greatly appreciate the interest you have shown in helping us to reach our goal of improving this route.

Pennsylvania Route 56 is the main access from U.S. 22 and the Pennsylvania Turnpike to Johnstown, the largest city in my Congressional District. Federal funding for a demonstration project on this road has been approved, and continued improvements will increase access to Johnstown from points east and west.

It is important to continue the work on these projects, as well as considering other important projects in the area. The importance of improved roads for the safety and economic development of our region cannot be over-emphasized. Beyond the expansion of some of the main roads in our area, funds for bridge improvement and reconstructions are urgently needed. Many of the bridges in our area are old and extremely dangerous. The Pennsylvania Department of Transportation has underway a extensive repair program, but we need to complete work on this concern as quickly as possible.

This has been a brief overview of the transportation situation in our area. The testimony of our public officials and private citizens will provide more details on specific projects that we are considering. Again, I would like to thank the Subcommittee for coming to our area and listening to our concerns on the future of highway funding. I hope our information has been helpful, and I will be available for further discussion about the transportation needs of our area with the Members of the Subcommittee at any time.

TESTIMONY OF PENNSYLVANIA STATE SENATOR WILLIAM J. STEWART

Senator STEWART. Thank you, Chairman Mineta and members of the Committee, Congressman Shuster, Congressman Clinger from our own area, and obviously, Congressman Murtha. Our sincere thinks for the opportunity to talk with you and chat with you today about our highway needs.

We really appreciate the opportunity to comment on the critical transportation needs—infrastructure needs of our region as you and Congress prepare to map out a strategy for the nation's highway future. Just as state legislatures will have to make difficult decisions when we redraw the legislative district maps and the Congressional maps next year, we know that Congress will have to make difficult decisions when you redraw the transportation needs map of not only this region, but the entire country.

I must say that we in the Pennsylvania legislature have been used to making difficult decisions regarding our infrastructure as federal dollars have been steadily decreasing. When federal sewer and water monies went by the wayside, we responded in Pennsylvania with a $500 million state bond issue. We call it PennVest.

We took the lead in funding a billion dollar program to repair and replace our unsafe and deteriorating bridges.

Our state and local government economic development efforts have been rated as one of the best in the nation.

And in the highway area, we even developed a strategy to construct and reconstruct some of our major roads as part of the Pennsylvania Turnpike system—construct and reconstruct them as toll roads. This is an onerous alternative to the historic freeway concept, but one that we felt was the only realistic way to accomplish what we need—what we all agree needs to be done. U.S. Route 219 is part of that package, and I would like to emphasize the "U.S." designation.

Alice Rivlin, former Director of the Congressional Budget Office and now with the Brookings Institute, has said, "If the United States is to have a world class economy for the 21st century, state governments will have to take that lead."

I submit to the Committee that Pennsylvania has demonstrated a clear willingness to do just that. And I must appeal to you to reverse the "fend for yourself federalism," particularly in the area of highway and mass transit needs.

One major highway need that desperately needs federal assistance is U.S. Route 22—specifically, in this area, from Mundy's Corner to Pittsburgh. Everyone in the economic development community has identified this connection to Pittsburgh as being critical to our future growth. Everyone in the Pennsylvania Department of Transportation recognizes this, as evidenced by a recent one million dollar commitment of state money to begin engineering and design on this section. And most assuredly, every member of the families of the 1,530 that have been killed or injured in a five-year period on this stretch of highway understand the critical need for improvement. But without federal dollars, this goal will probably never be achieved.

I congratulate you for the work that you have done and Congressman Shuster has done on the Route 22 section from Altoona to Mundy's Corner. But, we desperately need to continue westward.

I want to implore you that when you make those difficult decisions that I mentioned earlier, whether it be prying the highway trust fund money loose from the budget balance sheet—which I think is absolutely—should be a priority—or even to raising the gasoline tax. I implore you to consider prioritizing projects in states and areas—states like Pennsylvania and areas like ours—who have already made difficult fiscal decisions.

I feel certain that I speak for my colleagues in saying that we stand ready to assist you in this most important work. Our economic future in this region depends highly on what this Committee does or does not do.

We would like to thank you again for the chance to express what we feel is the majority opinion of our mutual constituents.

[The prepared statement of State Senator Stewart appears on p. 3088.]

Mr. MINETA. Thank you very much, Senator Stewart, for your very fine statement. When you say here that you have a difficult decision in terms of redrawing legislative districts and we have got a tough decision in terms of funding transportation projects, I am not sure. I think I would rather do what I am doing than trying to redraw legislative districts, especially when I see that from your Congressional perspective, I believe Pennsylvania will be losing—what? Two seats?

Mr. SHUSTER. We will be happy to help him draw the lines. [Laughter.]

Mr. TELEK. Just as we will be happy to map out the area.

Senator STEWART. We are going to keep this bipartisan transportation needs in this area?

Mr. MINETA. In terms of that U.S. Route 22 that mention in your testimony, when will the engineering and design phase of that be completed?

Senator STEWART. The million dollars I mentioned in my testimony was released about three weeks ago. That has already begun. It is primarily designed at this moment to add a climbing lane in what is known as the Chicory Mountain area. There is a lot of truck traffic on Route 22, and it is two-lane now. That section definitely needs a third lane, and that is about all Penn DOT says we can afford by ourselves—is a third lane to alleviate some of that truck traffic. Widening it to four lanes and extending it beyond that section of highway is certainly going to take federal dollars. But, what I want to stress is that Penn DOT and the legislature has made a commitment to come up with our share, whether it be 90/10 or 80/20. But, without the federal dollars, it is not going to happen.

Mr. MINETA. Well, I appreciate the attendance of the Representatives to the State House from the county as well.

Mr. Shuster.

Mr. SHUSTER. Thank you very much, Mr. Chairman. I simply want to thank you for your testimony and all of you being here today.

Mr. MINETA. Mr. Roe.

Mr. ROE. I echo the sentiments. Thank you very much for your testimony.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you for your testimony very much. No questions, Mr. Chairman.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. I would like to also thank you for your testimony. But having driven on Route 22 from this area to Pittsburgh, I can only say, "Amen," that it is desperately in need of upgrading. My only question would be, if it was, in fact, upgraded to a four-lane limited access or even an improved 22, how long do you think it would take to get from here to Pittsburgh?

Senator STEWART. As far as constructing the road or in travel time?

Mr. CLINGER. Travel time.

Senator STEWART. Congressman, it would probably cut the travel time by one third. But more importantly, commercial carriers would use less fuel. The natural commerce connection between Johnstown area and Pittsburgh would be greatly enhanced. And I think there is a clear economic need, as I mentioned in my testimony, that the best and the brightest of those who deal with economic development have said that time and time again.

Mr. CLINGER. Thank you.

Mr. MURTHA. And the safety aspect is tremendous.

Senator STEWART. Yes, again in my testimony, the—in a five-year—recent five-year period, there have been 1,530 deaths and injuries on that section of highway that are primary—were primarily caused by its design. It is two-lane. In some places, it goes to three lane and then back to two lane with very little warning. It is a—it is just a horrendous situation. And we need your help with it.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions, Mr. Chairman.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. Mr. Chairman, I would just say that Route—U.S. Route 22 bisects my Congressional district as well. And if there ever is a road of national significance, that is it, and I will do all that I can to assist.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. No questions, Mr. Chairman.

Mr. MINETA. Mr. Lightfoot.

Mr. LIGHTFOOT. No questions.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. No questions.

Mr. MINETA. Mr. Hancock.

VOICE. He is not here.

Mr. HASTERT. He fell off the counter. [Laughter.]

Mr. MINETA. That is what he gets for being a freshman.

Let me again thank you, Senator. Are there any members of the Representative—or the State Representative body that would like to make any quick statement?

Mr. HALUSKA. I would like to make one.

Mr. MINETA. Okay, Mr. Haluska over here. Okay, who is Mr. Wozniak?

Mr. WOZNIAK. I am Mr. Wozniak.

Mr. MINETA. This gentleman's cousin is a constituent of mine.

Mr. WOZNIAK. I sent him a fund raising letter.

Mr. MINETA. Is that right?

Mr. WOZNIAK. He sent a brochure back.

Mr. MINETA. Is that right? Steve Wozniak is a very good friend, and he is a resident in my constituency.

Mr. HALUSKA. Members of the Committee, I would like to call one matter to your attention. I think the Federal Government just recently has made a study of tourism in rural U.S.A. I mean, we have an exodus of industry from all rural areas, not only in Pennsylvania, but across the nation. And they came out with a report that simply states that they should now look at their natural resources in rural America to try to take advantage of the great resources they have of water, ports, historic sites and et cetera, and try to build an industry in each respective community. And they pointed out very vividly that 28 people, as tourists, coming into any area in one year's time—28 people a day is the equivalent of $100,000 payroll in that community, without the responsibility of providing schools and so forth. So, I think it is important that we try to get our major arteries of transportation into the rural areas to make it possible for the people to enjoy a new industry.

In Pennsylvania tourism is the second largest industry. I think across the nation, it is the third largest industry. And it is proposed that within the next ten years, that this will be number one in Pennsylvania and number two across the nation. So, I think we should look into this very seriously and try to do everything we can. It not only does that. It enables the people in the rural areas, if we have good access, to get into metropolitan areas, not only for recreation, but for educational and cultural purposes as well, and I think this is very important to do that. Thank you, sir.

Mr. MINETA. Thank you very, very much. Again, Senator, appreciate your presence here and to the members of the panel with us. I appreciate it.

I would like to now call on the Somerset County, state and local legislators, Senator William J. Lincoln, accompanied by Representative William R. Lloyd, Jr., and County Commissioner Brad Cober, Commissioner Robert J. Will and Commissioner Greg Chiapelli.

Senator Lincoln, your statement will be made a part of the record, and so, if you would proceed in your own fashion, sir.

TESTIMONY OF PENNSYLVANIA STATE SENATOR WILLIAM J. LINCOLN

Senator LINCOLN. Mr. Chairman, thank you very much. I also would like to echo the sentiments of the previous speakers and everyone who probably will follow in our appreciation for your bringing the Subcommittee into this area. You will hear many statements of the importance of roads throughout the period of time that you are going to be here today. And, I have a prepared statement; but, I think probably, I do things better a little bit off the cuff. And, I would like to thank Congressman Murtha and Congressman Shuster and Congressman Clinger for bringing this very important Subcommittee into Pennsylvania to see first-hand how

badly we need 22 and the 219 corridor from New York to Maryland.

And—before I do that, though, I would like to get into just one little story about Jack Murtha. And, Mr. Lightfoot reminded me of this. My first impression of Jack Murtha came back in 1973 when he and I served together in the Pennsylvania House. And many of you remember that that was the time in the history of this country when it was very popular to be critical of our country and burn flags and do all the other horrible things that people were doing. We had one freshman member of the House that came in with me at that time who was up giving a speech one day, being very critical of this country and demeaning and just about as bad as you could be. And my first impression of Jack Murtha was this much thinner, very fiery young Marine charging down the floor of the House and taking the microphone and giving the best defense of this country that I have ever heard. I will never forget that. I think it is something that truly gives you the type of person that Jack Murtha is. And if I live to be 100 and he lives to be 110, that will never leave me.

And, my respect for him has just grown since that period of time. I also have a strange philosophy, being in politics at least two-thirds of my life now. I really admire ability, but I respect power. And Jack Murtha has combined both of those. And he proved that to me recently when he went into Washington and shook that big tree down there and came up with $60 million for the Myersdale Bypass, which is a very important link in getting 219 finally completed. So Jack, I thank you personally for your activity on behalf of what is part of my district and yours.

The 219 project——

Mr. MINETA. Senator Lincoln, you think of it as the Myersdale Bypass. We think of it as the Murtha Bypass. [Laughter.]

Senator LINCOLN. Well, just as long as it does not become a memorial Murtha Bypass. [Laughter.]

The 219 project is the one that I would just briefly like to off the cuff speak about. We have all the ingredients in this area for getting back economically to where we were a number of years ago and where we could be in the future. We have good, hard-working people. We have a tourist promotion effort in Pennsylvania. It is bringing millions of people in. We have high tech studies and universities developing those high tech studies. We have the potential for opening international trade through all of—through Canada and New York, Pennsylvania, West Virginia and Maryland. We have a—all the good ingredients that we could need. We also have a road that is over-traveled, winding, hilly, absolutely a total impediment to anything good happening economically in this whole central part of Pennsylvania. With your help and the good Congressman from Altoona and Bedford County and Blair County, and I am trying to think of the home county. Forgive me.

Mr. SHUSTER. Bedford County.

Senator LINCOLN. Bedford, okay. I know the hard work that he and Jack Murtha have combined together on bringing roads throughout Pennsylvania, not just in their districts. And with your recognizing the need by coming here today, their efforts, I think, will be successful, and ten years from now, we are probably going

to see a much better economic climate in this part of Pennsylvania. And, I personally appreciate that because I have seen the bad days, too.

So, I am going to shorten my statement because I know you have a lot more to go. And thank you very much.

[The prepared statement of State Senator Lincoln appears on p. 3046.]

Mr. MINETA. Well, thank you very much, Senator. And let me also—I should have mentioned this earlier, but—and I am not really sure as we rewrite this new highway legislation what it really is going to look like today. I do know that there are some very general principles that we are trying to follow in terms of crafting this new legislation. One is, what will this legislation do in terms of highway and transit type programs for urban and rural needs in terms of helping our companies be internationally competitive? What will this legislation do to help local and state governments do economic development? What will this legislation do to help in terms of the quality of life? What will this do to help us in terms of public safety? And, what will this legislation do in order to keep a consistent, stable, flexible source of funding from the federal levels to local and state government? And so, with those broad principles, I think we are trying to encompass those kinds of things that both you and Senator Stewart have tried to bring to us in your statements.

I would like to ask, however, in reading your statement—I would like to ask about this Route 219 because you refer to an upcoming meeting with state officials regarding the inclusion of Route 219 on the Pennsylvania 12-year transportation plan. Are you fairly optimistic that Route 219 will be included in that plan?

Senator LINCOLN. Mr. Chairman, I believe that the time has come for that to happen, so I would have to say, yes, I am optimistic. The reason for the exclusion from the 12-year plan 10, 12 years ago was that Pennsylvania had themselves in a position where they were borrowing more money to build roads than they could afford. And we went through a period of time where we really did not have a lot of construction using state dollars. And, the 12-year plan reflected that in the manner in which it was put together. I believe that next year, whenever the hearings are held and the recommendations are made for changes in the 12-year plan, that you will see a very bipartisan concerted effort by all public officials within that corridor in getting the 219 projects back into the first four years of the 12-year plan.

Mr. MINETA. And, do you anticipate a speedy environmental clearance for Route 219, given that there is, I guess, some local opposition to various segments of the proposed project?

Senator LINCOLN. I can speak for the section south of Somerset borough to the Maryland border, in which Congressman Murtha was successful in getting the $60 million for the bypass, which is part of that section. And the state released $500,000 at that time to update the environmental impact studies. Now, this project was funded about 20 years ago. All of the design, right-of-way and everything else was in place. And because of local opposition, failed to be built. And as you know, the cost is extremely higher now, and there are now environmental impact studies that must be in place

that we are prepared and we are moving forward in that aspect of 219 south of Somerset.

Mr. MINETA. That is a growth in estimate of the costs at that time compared to today is what?

Senator LINCOLN. Probably four or five times—six times—eight times. It is hard to tell. But, I would think as it was, say, a million dollars a mile 15 years ago, it is probably $10 million dollars a mile now.

Mr. MINETA. Very well. Mr. Shuster.

Mr. SHUSTER. No questions. We just very much appreciate your testimony.

Mr. MINETA. Mr. Roe.

Mr. ROE. Yes, thank you, Mr. Chairman. I realize time is short, but I think you are making an extremely important point and so did the panel before. America has a tendency—and everybody is in the budget mind at this time—to cut here, cut there. What we have been trying to get across to them, under the leadership of Mr. Anderson and Mr. Mineta of this Committee, is that as we invest in the highway transportation system and improve the bridges and provide the access to a state as beautiful as yours, in effect, you are creating new wealth. That is where the new wealth of America is going to start to emerge. So that when we are spending one dollar, which in a way, that is saving on the budget. And, we are going to make ten. It seems to me, you ought to spend the $10. You ought to spend it, be able to make the resources to pay the deficit in the first place.

So, I would hope, if I may make the suggestion, Mr. Chairman, that as the new program—the 12-year program—unfolds, somebody ought to do an overview in Pennsylvania, I would think, and would come back and say, "Basically, if we make these kinds of investments, here is how we will estimate what it will mean in the increase of revenues coming into the state of Pennsylvania." So that we start to change the mindset in America—when we are investing something to create new wealth, we are improving our country versus the point of retracting and retreating from what we attempt to be doing so far.

I just want to make that observation. And, thank you for the input you have made to the Committee.

Senator LINCOLN. Mr. Roe, I would think that your statement probably is the most encouraging thing the people that live in this depressed area could hear because that means that there are people outside of our area that are listening to Congressman Shuster and Clinger and Murtha.

Mr. ROE. That is true.

Senator LINCOLN. And, we do need that help.

Mr. ROE. Everybody from New Jersey listens to Shuster. [Laughter.]

Murtha and Bill Clinger.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman. Senator Lincoln, we appreciate your statement very much.

Let me just comment on something that my colleague, Mr. Roe, just said. He may have inadvertently misled the general public, and I think it is something that needs to be said about the deficit.

You know, highway trust funds do not have anything to do with the deficit. They come out of dedicated revenue. That is an important point for the general public to understand. I know you all understand it because you are professionals and you work with it. But sometimes, the general public and the media thinks when you are spending all of these dollars that you are spending it out of the general treasury, but you are not. You are spending it out of the trust fund that cannot be spent for any other purpose.

Mr. ROE. Will the gentleman yield?

Mr. HAMMERSCHMIDT. I yield to my friend.

Mr. ROE. I think the gentleman is right. I was not inadvertent, because I think one thing ought to be said, and I am so glad you raised the issue. One thing the legislature of Pennsylvania ought to say to the Congress of the United States—and that includes me and everybody here, and particularly what is going on right now—that Mr.—John Paul Hammerschmidt is absolutely correct. The Congress of the United States should not use public trust funds that are paid for by the people of this country against their automotive, gasoline and their fuel taxes and so forth and shield the debt with it. That is not fair to the people of this country, and that is the point that I think has to be made.

I thank the gentleman for yielding.

Mr. HAMMERSCHMIDT. Well, I agree with all you have said. It is just that it is such an arcane process, the general public gets lost in all this complicated budget procedure, and that is exactly what they are doing. They are shielding the deficit by not spending the dollars that cannot be spent for any other purpose.

Thank you very much for your testimony.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. Thank you, Senator, for your very excellent testimony.

With regard to 219, which Congressman Murtha has been very effective in promoting, do you see that as between 219 and 220 that they are competitive, are or they complementary, in your view?

Senator LINCOLN. Congressman, I believe that the success with 220—the completion of 220 in the area that I am familiar with has had a tremendous impact on the economy of the area, and I think rather than being competitive, I think we will use that as an example as to why we should continue to press forward for completion of 219.

Mr. CLINGER. It would actually benefit both corridors, I think.

Senator LINCOLN. Without question, I would agree with that.

Mr. CLINGER. Thank you very much.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. Just one point on 219. And, Bill talked about how it was held up and the extra cost. We actually had federal dollars available early on in the Appalachian Regional Commission money. And of course, because of a few people, that highway has not been completed and is going to cost a lot more money. So, it is unfortunate; but, it is something we recognized early on should have been done and just fell by the wayside because of bureaucratic regulations.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. No questions, Mr. Chairman.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. No questions.

Mr. MINETA. Mr. Lightfoot.

Mr. LIGHTFOOT. I am busy pouring water, Mr. Chairman. I am taking care of our distinguished colleague from New Jersey.

I would only like to add to your comments about writing the new highway bill. I come from a very rural state with many, many miles of interstate and not very many people, and the formulas do not work for us, as is common in many rural areas. But, there is also an old proverb that we live by in our part of the country that a successful rain dance is the result of good timing. [Laughter.]

Quite frankly, I think that is where we are in this whole highway process, that the time is right to what the Chairman alluded to a moment ago. That we are looking at a lot of things—economic development and safety and so on. It is time to get on with the rain dance.

Thank you gentlemen for coming.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. No comment.

Mr. MINETA. Mr. Hancock is not back yet. Still has not found his——

Senator LINCOLN. We have these very fine Commissioners, and I know, having come from local government myself—again, if you would like to mapposition which has already been raised twice. I believe, at least in southern Somerset County, where we desperately need this, we have lost some economic development because of poor access. I believe that the time is right also, that the opposition is gone, at least from the southern section, to be completed from here south. So, I just want you to be aware of that. Any efforts you could do would be greatly appreciated.

Mr. MINETA. Thank you very much. Mr. Will.

Mr. WILL. I do not want to be repetitive; but, along with those comments, we have 219 from Ebensburg to Somerset, and it is sort of dead ended in both places. And, it would be a great benefit if it was connected from Somerset to Route 48, the Maryland line. I want to thank the entire Committee.

Mr. MINETA. Well, thank you very, very much, Senator Lincoln and Mr. Will and Mr. Cober.

Senator LINCOLN. Thank you.

Mr. MINETA. Now, I would like to call on the panel from the Westmoreland County. And, that is Representative Thomas A. Tangretti, accompanied by Paul Parsells, Executive Director of the House Transportation Committee.

It is my understanding that Representative Petrarca, who is the Chair of the House Transportation Committee is unable to make it, and so, Representative Tangretti will be making the statement on his behalf. That statement will be made a part of the record, and so, if you would go ahead and proceed in your abbreviated form. Thank you.

TESTIMONY OF STATE REPRESENTATIVE THOMAS A. TANGRETTI, ON BEHALF OF STATE REPRESENTATIVE JOSEPH A. PETRARCA, BOTH FROM PENNSYLVANIA

Mr. TANGRETTI. Thank you, Mr. Chairman. I appreciate the opportunity to be here on behalf of Mr. Petrarca, who regrettably is unable to attend. But, Mr. Parsells, as you indicated, is here, Staff Director of the Transportation Committee of the House, as well as James Dill, Administrative Assistant to Senator Porterfield from Westmoreland County.

Mr. Chairman, we are beginning a decade which I believe will prove to be the most critical test of our ability as individual states and as a nation to meet our transportation needs. The Persian Gulf crisis has given us the necessary and well-timed slap in the face reminding us that we will be unable to meet our transportation needs in the 21st century if we do not make critical decisions now.

Pennsylvania is prepared to make those decisions; but, we need the help of you and Congress and the Bush Administration. Clearly, we can no longer depend on oil as a reliable energy source in the next century. There are alternative fuels available that can be produced today that are not only a good substitute for oil; but are beneficial to both the consumer and the environment.

Specifically, compressed natural gas is a fuel which is abundant in supply burns much cleaner and is less expensive. And most importantly, the technology exists today to utilize it. I bring this to the attention of the Subcommittee for your consideration mainly for its potential applications in mass transit, a subject which I would like to discuss in more detail in a moment. Mr. Petrarca's Committee has had the opportunity to see this technology at work when we took a ride on a bus which was fueled exclusively by compressed natural gas.

Transit authorities are very interested in this technology; but they need help with the initial capital investment. While the operating costs are projected to be low, spending scarce mass transit funds to retrofit buses and to build pumping stations is very costly. If we could help with these start-up costs, the long-term benefit would be well worth it. This help should also extend to large vehicle fleets, such as school buses. And ultimately, I believe that we should concentrate our efforts and funding to make alternative fuels, such as natural gas, more accessible to the general public.

One of the critical decisions facing us today as we approach the next century involves mass transit. At a time when the Federal Government should be encouraging mass transit, it has turned its back on the states. The decision to mask the federal deficit by refusing to allocate funds from the more than $6 billion mass transit account of federal highway trust fund, we think, is irresponsible. The United States Department of Transportation Secretary Skinner has criticized Pennsylvania's public transportation financing. His criticisms and inactions on funding is not only insulting, but has caused great friction between members of the Pennsylvania General Assembly, as well as between our members of Congress.

For the information of the Subcommittee, Pennsylvania ranks second in the nation in its contributions to mass transit. Over the past eleven years, Pennsylvania operating assistance for urban

public transportation has nearly tripled. Local government assistance has increased by 72 percent. And federal assistance has declined by 87 percent.

Appendix A of written testimony is a copy of a resolution Mr. Petrarca approved, along with his fellow Commissioners of the State Transportation Commission, taking strong exception to Secretary Skinner's comments and inactions. The Commission is a bipartisan 15-member body established by statute to work with the state government to establish transportation improvement programs. I urge you to take the time to read this resolution so that you may better understand our situation. Secretary Skinner's inaction has created a sense of panic among elected officials in areas served by a crumbling mass transit. In Pennsylvania General Assembly, a bill was defeated which proposed a Constitutional amendment to allow monies restricted to highway and bridge improvements be used for mass transit. This legislative was very divisive to the Assembly because legislators unserved—or underserved by mass transit saw it as an effort by Philadelphia, Pittsburgh to grab monies critical to their transportation infrastructure.

In Washington, Congressman William Gray has added a provision to the House of Representatives Transportation Appropriations bill in a frustrated effort to help this problem. The amendment would require the United States Secretary of Transportation to withhold 25 percent of Pennsylvania's 1991 federal highway monies, unless we enact a dedicated mass transit revenue source.

Congressman Gray has a very unhappy constituents—constituency, and I am sure is trying to come up with the best solution possible. From a statewide perspective, however, I feel that this measure will create more problems than it solves. Pennsylvania does not react well to coercion, punitive legislation from Washington, and I can assure you that the resulting dedicated fund will do little to address this problem. I would hope that the members of this Subcommittee can convince Congressman Gray to rethink this proposal.

I would also hope that you will look very carefully at how the Federal Government is neglecting our systems, remembering all of the good work that was done promoting mass transit after the last energy crisis, and consider the wisdom of Secretary Skinner's inaction as the events in the Persian Gulf unfold.

The highway funding picture has been much brighter in Pennsylvania, thanks to the efforts of Congressman Murtha, my good friend, Congressman Kolter and Shuster and Mr. Clinger. Pennsylvania has received nearly $2 billion highway and bridge funds over the last four years, as well as nearly $800 million additional discretionary funds. This money, when combined with state, local and—state and local and an encouraging amount of private funds, has allowed us to rebuild crumbling infrastructure and has helped to promote transportation facilities vital to Pennsylvania communities hard hit by recent changes in our industrial base.

The strong federal, state and local partnership is critical to our nation's transportation needs and must continue. As we approach the next century, the Federal Government has an opportunity working in this partnership to prepare the country for the dramatic change in transportation that will occur.

Federal resources remain focused on critical transportation needs. As we enter the post-interstate era, I believe that we should begin to concentrate on maintaining the existing interstate and its supporting arteries. For example, as was mentioned numerous times this morning, U.S. Route 22, which traverses Westmoreland County, is in a very dangerous state of disrepair.

We also have many non-interstate missing links here in Pennsylvania that need your continued support. Route 356, for example, would open up much of the northern Westmoreland County to Pittsburgh markets. Relieving congestion in our facilities must become a priority in completing these missing links, particularly in the rural and suburban communities is essential.

This great public partnership we have focused should also be augmented by user fees. We, in Pennsylvania, have begun major projects that will be funded by tolls. Consideration should be given in Congress to allow us to toll existing facilities. Interstate 80, for example, costs Pennsylvania nearly $60 million per year to maintain. We believe that tolling facilities such as this way, in near future, will be the only practical way to keep it usable and safe without neglecting the rest of our system.

We must, however, do more than build more highways. We must find better ways to move people and freight. Efforts must be made to rebuild our rail systems. We cannot afford to let our rail rights of way disappear. We are very excited about the advances in high tech speed—high speed passenger rail technology. And I am encouraged that Washington has begun to take an interest.

We have the opportunity to go from a third world passenger rail system that we now have to a nation on the cutting edge. I am convinced that the implementation of an integrated, coordinated, high-speed passenger rail system in this country will be the first step in the ending of our love affair with the automobile, and we all know that that affair must soon end.

One final comment. There has been much discussion recently about the possibility of raising the federal gas tax for the purpose of deficit reduction. Those of you who—that serve on this Subcommittee, I am sure, will agree that this would be very detrimental to our transportation system, as would likely have occurred had the recent effort here in Pennsylvania to use the gas tax for mass transit been successful. Such a move in Washington would have made the gas tax fair game for every crisis that came along.

Thank you for inviting me here today. I assure you that the House Transportation Committee is ready to work with you on the critical issues of transportation needs of our nation. Thank you on behalf of Representative Petrarca and the rest of the Westmoreland County Delegation.

[The prepared statement of State Representative Tangretti on behalf of State Representative Petrarca appears on p. 3054.]

Mr. MINETA. Representative Tangretti, thank you very, very much for your very complete and fine statement. Let me ask how you would respond to someone who suggests that highways that are built with user fees, such as motor fuel taxes, should not be retrofitted as toll facilities.

Mr. TANGRETTI. Well, in the example that was cited in the testimony of Mr. Petrarca, I would suggest to you that a large percent-

age of the traffic on that interstate are non-Pennsylvanians, and it seems only fair that those non-Pennsylvanians should make and be able—be made to pay for the use and the maintenance of that particular facility. So, I would suggest to you that that is not a circumstance that is one that should not be considered.

Mr. MINETA. How do we get ourselves out of this Catch 22 we apparently are in right now that someone says, "Well, I am not going to fund anything in terms of transit if you do not have a dedicated fund." The constitution of your Commonwealth says, "You cannot have dedicated funds." And now, we have got a piece of legislation in the Transportation Appropriations Subcommittee that says—you know what it says. How do we get ourselves out of that Catch 22?

Mr. TANGRETTI. I would suggest that that $6 billion that is sitting in Washington could be tapped to help the circumstance as it relates to SEPTA particularly, where all of the problem occurs. A large part of Pennsylvania problems, the mass transit fund split—and Paul, correct me if I am wrong—is 70, 25 and 5.

Mr. PARSELLS. Right.

Mr. TANGRETTI. Where SEPTA and Philadelphia system gets 75 percent of the mass transit, Port Authority 25 percent and the rest of the state divvies up the remaining 5 percent.

Mr. MINETA. How much does Pittsburgh—the PAT—get out of this?

Mr. PARSELLS. 25 percent.

Mr. MINETA. That is the 25 percent. I am sorry, Port Authority.

Mr. TANGRETTI. Correct. Yeah. So, as a consequence, the rest of the state, and particularly, the rural areas are left wanting. And in Westmoreland County particularly, I have to tell you that we are a major corridor to the Pittsburgh market, and our mass transit system—although moving along adequately—is inadequate because of lack of funding. And we certainly, in Westmoreland County, could utilize additional funding for the system that we have. And, I would suggest that that would be an area that you ought to be considering, and I know you will.

Mr. MINETA. Thank you very much.

Mr. Shuster.

Mr. SHUSTER. We certainly appreciate your testimony. In fact, Representative Tangretti, you have given me an idea that I have asked the staff to pursue with regard to this problem in Philadelphia. It seems to me that we might consider in our legislation language that says something like this. "If funds are withheld from a state due to a lack of dedicated transportation funding source, then that state should lose 100 percent of its transportation—of its transit funds for those metropolitan areas of over two million people." So, if Philadelphia wants to play this game of penalizing the whole state, I think we should perhaps consider——

Mr. TANGRETTI. I do not think you want me to comment on that.

Mr. SHUSTER. Well, of course, my hope would be I would not really want to see this ever go into law; but, it seems to me it might be a way to get somebody's attention.

Mr. TANGRETTI. I would only offer this comment. Being from southwestern part of the state, it is easy to be Philadelphia bashers, and there are—not that you are, and I do not mean to

imply that—but, there are those who would make that a constant stream of political rhetoric. And, I think Philadelphia is a very large and integral part of the state economy, and I think we ought to take a whole state point of view. And, we need to solve Philadelphia's problem; but certainly, we cannot forget the rest of the state.

Mr. SHUSTER. I could not agree with you more. And Philadelphia, likewise, should take a whole state point of view. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Roe.

Mr. ROE. No comments, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you. No questions.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. I just want to say, Tom Tangretti used to work for John Dent for years. So, he has——

Mr. MINETA. Everybody knows Johnny.

Mr. TANGRETTI. I wish he were still around with us.

Mr. MURTHA. A good man—a good man.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. Nothing.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Nothing.

Mr. MINETA. Mr. Lightfoot.

Mr. LIGHTFOOT. I just appreciate your support for alternative fuel, especially when we raise so much corn. [Laughter.]

Mr. TANGRETTI. We do, too.

Mr. MINETA. Which raises an interesting question if I could ask about that because, you know, compressed natural gas vehicles will not be paying the gas user tax. The question is, that same vehicle that is powered by compressed natural gas uses the same space as a gasoline powered car or has the same weight as a diesel powered truck; but yet, they will not be paying any user tax. I think that is something that we would have to take a look at in terms of how we deal with that issue.

Mr. Hastert.

Mr. HASTERT. Nothing.

Mr. MINETA. Mr. Hancock.

Mr. HANCOCK. Nothing.

Mr. MINETA. Okay. Again, thank you very much, Representative Tangretti and Mr. Dill and Mr. Parsells for your being here.

Mr. TANGRETTI. Thank you.

Mr. MINETA. At this time, I would like to call on Mr. Richard H. Mayer, Chairman of the Board, Johnstown Tribune Publishing Company. Mr. Mayer, we are pleased to have you here. Your statement will be made a part of the record. If you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF RICHARD H. MAYER, CHAIRMAN OF THE BOARD, JOHNSTOWN TRIBUNE PUBLISHING CO., JOHNSTOWN, PA

Mr. MAYER. Thank you, sir. I am going to deviate a little bit from my written testimony, if I may. I am delighted to be the first

private citizen here in this—testifying in front of you. You fellows are the ones who fund and build the highways, and the rest of us are the people who simply hope to direct your interest in the way we think they ought to be done.

For 30 years, I have fought the fight for 219 north and south, and it looks as though that might get built in another 50 years. That is 80–85 years to build one highway. That—I do not think that that is right. I think that we should be able to fund and build highways and transportation systems much faster than that.

I do not know how long it is going to take to build 22—22 will be built. There is no way you can ignore 22. Pittsburgh is on one end, and the rest of eastern Pennsylvania is on the other end. 22 will be built. It will be four-lane or six-lane. Whether it is limited highway or not, that is something for political types to discuss. But, 22 will get built. I am not too concerned about that.

56 is the first diagonal highway that is needed in Pennsylvania. Most of our highways go north, south, east and west because that is how the people travel. We do need in Mr. Murtha's area between Indiana and Bedford linking Johnstown, we do need a highway—a decent highway—that goes diagonally across so that people in Indiana, if they want to go to Washington to see what their Congress is doing, do not have to go in a roundabout way going south and then east. So, I have no doubt that 219 will get built in 80 years. 22 will probably be four-lane or six-lane within 10 or 15 years. 56 might take a little longer, depending on Mr. Murtha's ability to change your minds and get a little money going in that direction.

What I would ask you to do, if you will, is to consider putting some money aside for a look at high-speed rail between Altoona and Pittsburgh. We have talked about high-speed rail going the other way, from Altoona to Philadelphia; but, we do not go that way any more. We tend to go to Pittsburgh. We tend to go to Pittsburgh and get on an airplane to go wherever we are going to go. We in Johnstown and in Altoona find it difficult to get to Pittsburgh in inclement weather. We have got little commuter airplanes that go that way; but, they do not go if it is bad weather—and thank God they do not because they are not equipped for it. But, high-speed rail is an interesting thought. You could start Greensburg to Pittsburgh. You could continue then from Johnstown to Greensburg to Pittsburgh. And you could bring it over the mountain, Altoona, Johnstown, Greensburg, Pittsburgh.

And, I think it might be worth your while just to take a look. I am not asking for big funding—but, just to take a look at the possibility of asking somebody to see if it is feasible.

Thank you very much.

[The prepared statement of Mr. Mayer appears on p. 3049.]

Mr. MINETA. Thank you very much, Mr. Mayer. Given the limited financial resources that we have and looking at 219, looking at 22, and then also looking at the topography that 56 is going to have to traverse, in terms of priorities, what do you think ought to be—how would you prioritize these three projects—219, 22 and 56?

Mr. MAYER. That depends on which hat I have on.

Mr. MINETA. All right, which hat would you like to wear to give us what your ideas of priorities might be?

Mr. MAYER. My Johnstown hat says, "For goodness sakes, let us do 56. It gets me in and out of town. It gets our tourists into town faster."

Mr. MINETA. But, that is the toughest one from a topographic perspective, is not it? Going through the mountains like that. Engineering is a great art, but——

Mr. MAYER. The—you know—the Pennsylvania Railroad had the same problem 100 years ago, and they got built fairly easily. It was privately developed—that might be one of the problems—rather than federally funded.

Mr. MINETA. After they got their federal land grants from the federal——

Mr. MAYER. Yeah.

Mr. MINETA. Let me ask about the fact that we have been—and you say, you know, from your perspective as a publisher of a very, very fine paper—we have been holding these kinds of hearings starting here in Pennsylvania, and we are going to go to different parts of the country to try and generate grassroots support for making transportation infrastructure an important subject. And unless we get that kind of grassroots support, it makes it tough on the Congress to act as well. But in light of this, has the Tribune-Democrat editorialized in support of increased funding for transportation at the state and federal level?

Mr. MAYER. Yes, sir. Absolutely. We have—we tried to push for an increase in the Pennsylvania gas tax, and it did not work. The politicians did not want it. I do not know where they expect to get their funding. But, we are in support of paying for what we ask for.

Mr. MINETA. That is great. Thank you very much. I appreciate that kind of support.

Mr. Shuster.

Mr. SHUSTER. I have no questions. I just appreciate very much my good friend's testimony.

Mr. MAYER. Thank you, sir.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. I just want to make one comment. I hope your prediction about 219 is off by a few decades.

Mr. MAYER. How long ago was it that we dedicated the Ed McNalley Bridge? 30 years.

Mr. CLINGER. Yes. Well, perhaps it is wishful thinking. I am hopeful that we are going to be able to accelerate that process. The only other thing I would comment is there are a number of us who are very interested in exploring the use of high-speed rail and mag lev in order to relieve some of the congestion we have at our nation's airports because of the fact that we have not managed to meet the demands that are now being placed on the airports. And, one way that we might do that is to use high-speed rail as a means of getting people to the major hub airports. So, I certainly agree with your thought that we begin exploring that in some depth. Thank you.

Mr. MAYER. Yes, sir.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. Let me just compliment Dick Mayer for all of the work he has done over the years in highway needs in this area. As a matter of fact, he was on the State Transportation Commission for ten years. And, he has been in the forefront, as his predecessor, Walter Krebbs, was in knowing the importance of highways in this area. And, we appreciate your continued hard work in trying to bring to the attention of people who will eventually make the necessary division in funds how important it is to our area.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. Nothing.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Yes, Mr. Chairman. I would just like to inquire if you feel that the state of Pennsylvania is average, below average or above average in terms of their commitment dollar-wise to highways in the state. That is in terms of all revenues for highways, gas tax and other sources.

Mr. MAYER. Presently, I think Pennsylvania is way behind. Way behind in the necessary—looking forward to the problems in order to get them funded in order to build the highway. I think Pennsylvania has taken a back seat.

Mr. PACKARD. And so, you feel that it is difficult for them to ask for a greater share of federal monies, particularly as those federal monies become matching monies, in most instances?

Mr. MAYER. I am not really in a position to comment on that. But, it looks to me as though Pennsylvania is looking to the state to do all of their funding on highways.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Lightfoot.

Mr. LIGHTFOOT. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. No question, Mr. Chairman.

Mr. MINETA. Mr. Hancock.

Mr. HANCOCK. No questions.

Mr. MINETA. Thank you very much, Mr. Mayer. I appreciate it very, very much.

Now, I would like to call on Mr. Lawrence A. Rogers, Transportation Representative for Bethlehem Steel Corporation's Bar, Rod and Wire Division, Bethlehem Steel Company in Johnstown, Pennsylvania. Mr. Rogers, we are pleased to have you here. Your statement will be made a part of the record. And so, if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF LAWRENCE A. ROGERS, TRANSPORTATION REPRESENTATIVE, BAR, ROD AND WIRE DIVISION, BETHLEHEM STEEL CO., JOHNSTOWN, PA

Mr. ROGERS. Thank you, Mr. Chairman, Mr. Murtha, Mr. Shuster. I kind of find it hard to follow such a group of people. I am not a professional as you people are, and my voice is quivering a little bit and it is because it is my first time.

As my statement says, I am Transportation Representative for Bethlehem Steel, and we are located in Johnstown. I do not know if you people have seen the latest conditions that have existed or

have been published in our newspapers where Bethlehem Steel has announced that they will invest $100 million into the Bar, Rod and Wire Division, depending on some concessions by their employees. With that, we feel that 56, 219 and 22 are very essential to the transportation and the growth of Johnstown area, as well as Bar, Rod and Wire Division.

Bethlehem is both a supplier to and a user of our country's highway system. We ship more than 400,000 truckloads a year. The efficiency and safety of the highways directly affect our operations. If we spend too little on maintenance, our ability to compete in the international economy will be weakened and our standard of living will suffer. We need a new federal commitment to upgrade and repair our highway system. Both economics and fairness justify allowing some preference to American businesses bidding on these projects. One billion dollars spent by the Federal Government on new highways increases total output in the economy by $2.4 billion annually and creates 50,000 additional jobs.

A great deal can also be done to improve productivity, efficiency and safety of the commercial use of the highway system. We need to eliminate unnecessary, outdated and inefficient regulations. We need to establish uniformity and reciprocity between the states on regulation, registration, taxation, and we need to establish strict truck rules.

Specifically, the reduced regulation of motor carrier entry and rates which has contributed hundreds of billions of dollars in savings on interstate trucking since its adoption in 1980 should be extended to the intrastate operations of those same carriers.

The cost of continued state regulation of intrastate truck entry and rates is enormous. Professor W. Bruce Allen of the University of Pennsylvania Wharton School estimates the cost at between $5 and $12 billion per year. Bethlehem Steel recently tried to inject some additional competition within Pennsylvania by sponsoring a trucker's application for authority to haul steel from our Johnstown, Bethlehem and Steelton plants to destinations within Pennsylvania. Our studies showed that rates within Pennsylvania were higher for the same mileage than they were if the destination was out of the state. The trucker has been carrying thousands of tons of steel from the same plants to destinations outside the state for several years. Therefore, there was no questions of his fitness; but it still took 16 months and $25,000 in legal expense to get an even highly restricted operating authority which forces inefficiencies on the trucking operations. The regulatory process denies the consumer the benefits of competition and forces motor carriers to operate unnecessary empty miles.

The diversity of state tax regulations also imposes large, unnecessary administrative costs on motor carriers operating in multiple states. More uniformity and reciprocity are needed to reduce such unproductive paperwork.

H.R. 4261, the Safe and Competitive Trucking Act of 1990, is directed at these improvements in the commercial use of the nation's highway system. We urge the inclusion of provision H.R. 4261 in the Highway Reauthorization legislation in 1991. Bethlehem Steel and the country's industries, in general, need the efficiencies these

provisions would bring to our distribution system if we are to be competitive in the 1990s.

First, we have to have a good highway system. And second, we have to use it efficiently. Thank you very much.

[The prepared statement of Mr. Rogers appears on p. 3066.]

Mr. MINETA. Thank you very much, Mr. Rogers. Mr. Rogers, in your statement, you refer to the use of incentive systems by transportation managers. What type of incentive systems would you envision being implemented in order to reduce congestion at peak hours?

Mr. ROGERS. I do not have an answer for that. I would like to look into it and give you a written reply.

Mr. MINETA. If you have a thought or two on that, if you would write to us on the Subcommittee, that would be fine.

[The following was received from Mr. Rogers:]

Bethlehem
BAR, ROD & WIRE DIVISION
JOHNSTOWN, PA 15907 (814) 533-7441

October 3, 1990

The Honorable Norman Y. Mineta
United States House of Representatives
2350 Rayburn House Office Building
Washington, D.C. 20515

Dear Mr. Mineta,

I want to express my appreciation for your courtesy in connection with my testimony before the Subcommittee on Surface Transportation of the House of Representatives' Public Works and Transportation Committee in Ebensburg, Pa., on September 17. Despite my nervousness, I enjoyed the experience and was particularly impressed by the manner in which you conducted the hearing and by the knowledge and thoughtfulness shown by you and the committee members.

With regard to your question on systems to relieve highway congestion at peak hours, I promised to supply additional thoughts. What we had in mind were things like high vehicle occupancy lanes, park and ride lots, toll structures which varied with the time of day, parking fees which encouraged the use of mass transit and, perhaps, some advanced technological devices such as automatic vehicle identifying toll machines with monthly billing. The Federal Government may be in the right position to encourage research and standardize approaches to the peak hours congestion problem. Federal funds might be wisely invested in demonstration projects and research and certainly in coordinating the standardization of technical approaches.

As we suggested in our testimony, how we operate and regulate both the passenger and freight traffic on our highways is extremely important in gaining the maximum return from our investment in steel and concrete.

Respectfully,

Lawrence A. Rogers

Lawrence A. Rogers

cc: Subcommittee members attending Ebensburg hearing
Rep. John P. Murtha

Mr. MINETA. You mention in your testimony that you support H.R. 4261, which is the bill introduced by our colleague from Illinois, Dennis Hastert. Are there other specific legislative proposals currently before our Subcommittee which you support and also wish to bring to our attention?

Mr. ROGERS. Not at this moment.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. I have no questions, and I appreciate your testimony.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions. I appreciate your testimony.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No questions.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions.

Mr. MINETA. Mr. Packard.

Mr. Lightfoot.

Mr. LIGHTFOOT. No questions.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. I appreciate your testimony, Mr. Rogers, and I would like to move forward and try to find some solutions to those regulation problems.

Mr. MINETA. I call on Mr. Robert D. John, Vice President of the 219 Association. We are pleased to have you here with us. Please proceed in your own fashion, sir.

TESTIMONY OF ROBERT D. JOHN, VICE PRESIDENT, ROUTE 219 ASSOCIATION, JOHNSTOWN, PA

Mr. JOHN. Thank you, Mr. Chairman. I am here as a representative of the Route 219 Association, which consists of six counties; Cambria, Somerset, Clearfield, Jefferson, Elk and McKean, with a population of about a half a million people. I am going to keep my remarks brief because I have given a written statement to the Committee.

Mr. MINETA. And that will be made a part of the record, sir.

Mr. JOHN. I hope all of you get a chance to review it.

Mr. MINETA. Yes, sir.

Mr. JOHN. As a former political writer for the Johnstown Tribune-Democrat, I can appreciate the fact that this Committee has taken the time from its busy schedule in Washington to visit this county and hear about our transportation problems. Several members of this group, Representatives Murtha, Shuster and Clinger, are well aware of our need for a modern transportation system. And I hope all of you will join them in making our highways and transit goals a reality.

One of those major goals, of course, continues to be completion of the north-south Route 219 as a four-lane limited access highway from border to border in Pennsylvania. The idea of the modern Route 219 originated back in the 1950s and received the endorsement of Governor David Lawrence, who at that time, stated, "Without highways, you cannot have industrial development. With-

out industrial development, you cannot achieve abiding prosperity." Every Governor since Mr. Lawrence has supported the 219 proposal. And while we have not set any construction records, by the end of this month, we will have 55 miles of the limited access four-lane Route 219 in use from Somerset to Johnstown and the Ebensburg area.

Of course, we still have a long way to go. We are hopeful that 219 can be completed as a toll road from Ebensburg to Bradford. And that funding would be provided by this Committee for construction of the 20-mile length between Somerset and Maryland. The Somerset-Maryland segment was part of the original Appalachian Economic Development Program designed to—which was designed, as you know, to aid economically distressed areas. With the approval of the Appalachian Regional Commission, a corridor was approved connecting Somerset to Route 48 in Maryland. Right-of-way was acquired for two sections of the highway. Final design was completed for two other sections.

When it was decided to phase out the Appalachian program, Congress recommended that Route 219 to Maryland be constructed during the phase-out period. Unfortunately, the money for this project went elsewhere, and we now have a four-lane highway to nowhere that ends in a wooded area in Somerset County.

Meanwhile, we have been working with New York State to extend 219 to Buffalo, and 37 miles of this highway have been completed in that state. Maryland officials also have made plans to provide a connecting link between the southern terminus of Route 219 and Route 48.

Robert A Gleason, Jr., President of the Route 219 Association, who could not be here today, has been conferring with Canadian officials on the possibility of extending this highway to Toronto. This would result in an international highway connecting Toronto to Washington, DC and the Baltimore area by 219 and Routes 48, Interstate Route 70 and 270. I might have a map on the wall there. Some of you may go see it. It shows how that highway would go.

And, Buffalo, New York, Mr. Gleason noted, would become the gateway city, linking the world's two largest trading partners. Mr. Gleason pointed out that the recent trade agreement between Canada and the United States could have a great economic impact on Route 219. Buffalo, New York, Mr. Gleason noted, would become the gateway city, linking the world's two largest trading partners. The trading agreement, he added, makes it mandatory to rebuild 219 as a four-lane limited access highway which would open up west central Pennsylvania as a new economic boom area to produce the goods that Canadians will be demanding from our country. There is no greater reason for a new U.S. Route 219 than the Canadian/United States Trade Agreement.

Thank you, gentlemen. That concludes my statement.

[The prepared statement of Mr. John appears on p. 3038.]

Mr. MINETA. Well, thank you very much, Mr. John, for your fine statement, both the submitted testimony, as well as your statement here this morning. I know that you have been a long-time supporter of 219 and associated with promoting 219. Given the recent free trade agreement between Canada and the United States, what kinds of products do you think will become increasingly dependent

or the existence of a good Route 219 between Canada and the United States?

Mr. JOHN. Under the sponsorship of the Route 219 Association, a study is now underway to answer that question, Mr. Chairman. We hope to have that answer shortly.

Mr. MINETA. And, do we have any kind of an estimate as to how much it will cost to complete this 130-mile segment of 219?

Mr. JOHN. That is from——

Mr. MINETA. To finish the 130 miles within Pennsylvania of the unimproved U.S. Route 219 to make it a four-lane limited access highway?

Mr. JOHN. No, $10 million a mile seems to be a reasonable estimate for these mountainous areas. I think Mr. Shuster would agree to that.

Mr. MINETA. Let us see now. My math is not that fast; but at $10,000 a mile for 130—what are we talking about—$1.3 billion? That is a sizable sum. Okay.

Mr. JOHN. It does not always run that high for every mile. But in the mountains, it usually does.

Mr. MINETA. Sure, recognizing the terrain it has to cover.

Mr. Shuster.

Mr. SHUSTER. I have no questions. I just want to welcome my old friend.

Mr. JOHN. Thank you.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions, Mr. Chairman.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. Mr. John, I want to thank you for your ringing endorsement of moving ahead with 219. Has the Association taken any view as to the priority of this thing? Obviously, given the price tag for the overall project, it would have to be done in pieces. Has the Association developed any priority listing of what segment they would like to see happen?

Mr. JOHN. The Association itself is pushing for the completion of 219 to Dubois. I personally favor completion of 219 to Maryland because it would connect us to the entire southern interstate system and would open up the whole Somerset area to industrial development.

Mr. CLINGER. All right, but the Association says——

Mr. JOHN. Yes. Because they are proposing a toll road, they had an engineering firm do a study of the area between Dubois and Somerset, and they proposed two corridors, one of which will be adopted as the corridor for the toll road.

Mr. CLINGER. Thank you.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. I just want to say, Bob, not long ago, I called a good friend of mine and he was a big supporter of the Boy Scouts. I knew he was dying when I called him, but he made an appeal for the Boy Scouts. This guy is supposed to be retired. I know if you call him on his death bed, his last request will be, "Finish 219."

Mr. JOHN. We have one Congressman who wants to be—late Congressman, Saylor—I might as well mention him—he wants to be—well, reincarnated, I guess, and travel over the new highway.

Mr. MINETA. Mr. McEwen. He is not here.

Mr. Packard.

Mr. PACKARD. What, in your judgment and the judgment of the Association, are the predominant impediments to the project moving ahead? What needs to be done besides more studies?

Mr. JOHN. We have had enough studies. Like I say, right now, we are hopeful here in Pennsylvania, to have the toll road system proposed. We are building a Westmoreland toll road section and put Allegheny County on toll road. If we get on a toll road set-up, then of course, it will pay for itself. We hope there will be enough traffic. The southern section is also part of the toll road, but it is in the third phase of the program and we are more anxious to get some funding for that between the federal and state government.

Mr. PACKARD. Is the problem mainly with state government or with the Federal Government?

Mr. JOHN. Well, with the Federal Government to some extent. The Appalachian—you know, the 20-mile section from Somerset to Maryland was part of the original Appalachian Program, which provided 80 percent federal funding. And they started doing all this work on it, get the right-of-way and everything. And, when the Appalachian program was phased out, we were recommended for completion by the Commission and the Governor. But, the funding—Appalachian funding went elsewhere.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. MINETA. Mr. John, just on that point about the toll road. Do you fear that if, in case, that there might be some movement of traffic from 219 over to 220 if 219 were a toll road?

Mr. JOHN. Well, of course, 220 is an important north-south highway, too, as Mr. Shuster knows. But, no, I think what we are hoping, if we complete—as that map shows—our highway to Toronto, Canada, there is going to be a big increase in traffic from Canada down through New York and Pennsylvania to the Washington state—to Washington, DC and Baltimore. So, both highways are necessary.

Mr. MINETA. Okay. Mr. Lightfoot.

Mr. LIGHTFOOT. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. No questions.

Mr. MINETA. Well, Mr. John, thank you very, very much for your testimony and for your fine work over a long period of years in terms of what you have done in promoting transportation and safety. Thank you very much, sir.

Mr. D.C. Nokes, Jr., Chairman, Highway and Transportation Committee, Greater Johnstown Chamber of Commerce. Mr. Nokes, your statement will be made a part of the record. And so, if you would go ahead and proceed in your own fashion, sir.

38-253 O—91——95

TESTIMONY OF D.C. NOKES, JR., CHAIRMAN, HIGHWAY AND TRANSPORTATION COMMITTEE, GREATER JOHNSTOWN CHAMBER OF COMMERCE, JOHNSTOWN, PA

Mr. NOKES. Thank you very much. In addition to being the Chairman of the Highways and Transportation Committee, which is an unpaid office, I also chair four Johnstown-based corporations. So, I will be addressing basically the economic impact of highways and how important that is to our region.

In 1964, a report was completed entitled, "What Future Do Kids Have Around Here?" The consultant's task was to identify the problems facing the Greater Johnstown area. And the four that they identified in that report in 1964 were poor transportation access to our area, outward migration of our youth, chronic high unemployment and having reliance on steel and coal. I was ten years old, and now, 26 years later, we are really facing many of the same problems. And, it is important to note that I think the poor transportation access will solve—if we can solve poor transportation access—we will go far to help the economic development of our region.

Many citizens of our region have toiled long and hard and continue to work hard to enhance the economic climate of our region. But, the poor highway access to the Greater Johnstown area makes our efforts not only difficult, but nearly impossible at times.

Our economic development representatives have for years boasted that 50 percent of our population is within 500 miles of Johnstown, Pennsylvania and Altoona. That is the good news. The bad news is, the proximity really does not help us a great deal, unless we can get our products to those 500 people in that radius and 50 percent of the population. So, it is also important that we try to bring those people here for our tourism, recreation opportunities and to consider economic development sites. As you have heard already, our region has analyzed and reanalyzed what highway corridors are the top priority. Route 22 to Pittsburgh, Route 219 north and south, Route 56 to Bedford, and I submit that the completion of any corridor is essential to those of us seeking to create economic revitalization and to solve the problems identified in 1964 and repeated in many reports thereafter.

We must—and I emphasize, we must—that is, I am suggesting to you the people of our region are anxious and, in fact, for many decades worked hard on economic development. But, we will work with you—and I pledge to you my personal commitment for the rest of my lifetime as one of the five people under 40 that is probably going to live here the rest of my life for sure—that we will work with you if you can help us with the transportation. And we must also, of course, work with the state of Pennsylvania.

So, I look forward to optimistically working with you on those different programs. No other problem is more often mentioned when we survey local businesses as an impediment to economic growth in our region than poor transportation access, and the principal concentration is on highways. As a representative of the Greater Johnstown Chamber of Commerce and the Johnstown Area Regional Industries Board of Directors, and the Economic Development Corporation of our two-county region of Cambria and

Somerset Counties, we ask that you join in partnership with us to offer our children—and I have got four urchins at home—the opportunity to create a greater future for our region.

And, I will be happy to address any questions any of you may have.

[The prepared statement of Mr. Nokes appears on p. 3051.]

Mr. MINETA. Thank you very much, Mr. Nokes. That is a very telling story when you say that the 1964 report identified these, and now at this point, 36 years later, we are revisiting that——

Mr. NOKES. Right.

Mr. MINETA [continuing]. Same—the same reasons. Has the Chamber looked at this issue in terms of these three roads here and come to any kind of conclusion as to whether or not they would support a state or federal gasoline tax increase to fund these improvements?

Mr. NOKES. I am not really certain. But, one thing that I guess you addressed and maybe some of the other members feel the same way, I do not think you guys can be out there alone pitching the hard solutions. And, I pledge to you, I will work toward whatever resolution you guys recommend to us that will work. And, I realize it is a hard choice; but, we are willing to make the hard choices here to accomplish whatever it takes to get the roads done.

Mr. MINETA. The gasoline tax here in Pennsylvania is how much?

Mr. NOKES. I am not really sure.

Mr. MINETA. It is about 12 cents. Is is 12 cents for gasoline tax? Okay.

Mr. Shuster.

Mr. SHUSTER. I have no questions, but appreciate your testimony. Thanks.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you for your fine testimony. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. I just want to say, D.C. Nokes is a long line of business family working for highways and progress in Johnstown and the surrounding area. We appreciate it, D.C.

Mr. NOKES. Yes, sir.

Mr. ROE. Will the gentleman yield?

Mr. MINETA. I was just going to ask if you would yield. Again, this thing about if you took Johnstown as a center and drew a ring 500 miles around it. Now, within that ring, there would be 50 percent of the population of the United States would be in that ring?

Mr. NOKES. Yes, sir.

Mr. ROE. We do not include New Jersey either.

Mr. MINETA. Everybody claims New Jersey——

Mr. ROE. Includes New Jersey.

Mr. MINETA. Includes New Jersey. But, that is a hard statistic to fathom. That 50 percent of the U.S. population is within 500 miles—Chicago, New York, Philadelphia.

Mr. NOKES. Washington.

Mr. MINETA. Washington, DC.

Mr. NOKES. I do not know if we have Iowa out there.

Mr. ROE. Will the gentleman yield?

Mr. MINETA. Mr. Murtha, it is your time, sir.

Mr. MURTHA. I will yield to the gentleman.

Mr. ROE. You know, you make two good points there, it occurs to me. One, that one of the major issues facing the evolution of the Soviet Union and Eastern Europe absolutely unequivocally, they have no distribution system and people cannot get around those countries in that vast empire. And, that could bring down that government in due course, unless they do something dramatic about that.

It seems to me that there ought to be a new view taken in this highway transportation bill. I think you make a very good point. If you are trying to increase the source of revenue throughout an entire state, you know if it is the urban centers and so forth, they have what they perceive to be their needs. Rural areas have what they see to be their needs. But when you talk about taxing ourselves to achieve something, in open candor, there is not enough votes in western Pennsylvania against the cities to be able at this point to divert any economic resources to this area.

And it may be, Mr. Chairman and fellow colleagues on this Committee, that we ought to consider a formula somehow that emerges out of this new highway bill that gives recognition to that fact and maybe the state legislatures ought to say to themselves, "Well, if there is a particular capital improvement that has to be made in any region of a state," and you can delineate the service area. I think that is what Mr. Mineta was beginning to approach. If you delineate the service area, why should those people not be given the opportunity to tax themselves if it would achieve the economic dynamics they are trying to achieve? I think maybe we have to take a whole fresh look as to how we raise funding, both at federal and state levels, to achieve specific goals, if I am making any sense to you. And, I think that might be something worth pursuing, and we will look into that issue for you.

Mr. NOKES. Thank you.

Mr. LIGHTFOOT. I thank you.

Mr. MINETA. Mr. McEwen is not here.

Mr. Packard.

Mr. MCEWEN. Mr. McEwen is here.

Mr. MINETA. Oh excuse me. I am sorry. Back again. I am sorry.

Mr. MCEWEN. I have nothing.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Yes. I would like to expand on what Chairman Roe just spoke of. In California—and I can use that perhaps as an example—we are struggling with the same problems, being able to get enough local matching money for transportation to even apply for federal monies. But, we are struggling with transportation problems also. Not all, but many of our counties have put on the ballot—and many of them have passed—a half-cent sales tax, for example, that is earmarked for transportation purposes only. And in order to get the voters to be willing to support a self-taxing proposition on the ballot, the money was to be distributed to counties

getting a third of the funds, cities getting a third of the funds and mass transit programs getting a third of the funds. It was very attractive in the County of San Diego, where I live. It passed by 78 percent. And, we now are starting. That was just a year and a half ago. We are now starting to get literally millions of dollars into our cities and into the county of funds that we can use to leverage for state and federal funds.

One of the problems we have in our cities often, and in the county, is that we simply—even if we can get federal funds, we cannot get the matching funds to make it all work. And, I think I have heard the testimony today that indicates that there are some projects that has gone wanting here in Pennsylvania simply because there was not the matching funds available.

I think we are going to have to look more and more for local and state monies to do more and more for highway and, frankly, for all public works projects. That the Federal Government simply is not going to have 90/10 monies or even 80/20 monies very much longer. We are going to have to see more coming from the local sources, and that means we are going to have to look for innovative ways to raise that money at the local level. I was wondering if anything is being done or if it is even being discussed in terms of county right here in the two counties you are referring to—any thought to methods of raising local money?

Mr. NOKES. I know our Cambria County is concerned it may not be able to fund all the projects currently underway for this current fiscal year. Although, Somerset—the one to our south—is in a little bit better fiscal position. And, I think the rebuttal would be that there is enough on their plate already that they may not be able to address this. But, it is a matter of whether we are going to address it first and get enough revenues, and it at least has to be considered. And, I will share that with our Commissioners in both counties and see what response we may get.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Lightfoot.

Mr. LIGHTFOOT. Thank you, Mr. Chairman. I just tag on to what Mr. Packard was saying, only with a little bit of a different approach. There is also another figure that says 75 percent of the people in the United States live within 100 miles of a major ocean, which basically puts it East Coast and West Coast. And, I live right out in the center of that, and Lake Manawa does not qualify as a major ocean. In fact, in a dry year, you can walk across it.

But, one of the problems that we have in our area, and you are suffering from that same dilemma to some degree—we do not have a tax base big enough to support doing a lot of these kinds of things. The people are not there; the resources are not there. We have in Iowa now the highest state gasoline tax of any state in the nation, and we are pretty proud of our roads. But, that was a difficult issue to pass the state level, and particularly when you have border counties and states next-door that are 6, 7, 8, 10, 12 cents a gallon less. The competition becomes very tough at the Mom and Pop stores and the gas stations and so on.

But again, I think it is a basic unfairness that is in the formula system, and we need to devise a system that determines where the needs are, rather than where the people are because the old ration-

ale has been where we have people, that is where the problems exist, and that is not necessarily so, I do not think.

Thank you. I appreciate your comments.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. No questions.

Mr. MINETA. Well, Mr. Nokes, thank you very, very much for your chairing that committee for the Greater Johnstown Chamber of Commerce. Just out of curiosity, professionally, what kind of work or business are you in?

Mr. NOKES. Well, my principal vocation, how I feed the Nokes children is outdoor advertising, which I will not burden you guys with. You will hear enough about that later.

Mr. MINETA. We will hear about that, also.

Mr. NOKES. I do not think today. But, I would commit to you gentleman that if you need a rational voice of somebody that owns and operates an outdoor advertising facility fairly, honestly and without violation of federal state law, I am willing to represent that interest to you and would be available to come to Washington any time to discuss the prudence of any legislation that might affect our industry.

Mr. MINETA. I will highlight your name, sir.

Mr. NOKES. Thank you.

Mr. MINETA. I would like to call on next a panel made up of Mr. Harold C. Jenkins, Executive Director, Cambria County Transit Authority, accompanied by Ms. Vickie Shaffer, General Manager, Tri-State Transit Authority from Huntington, West Virginia; Mr. Kevin Abbey, President, Pennsylvania Association of Municipal Transportation Authorities and General Manager of the Centre Area Transportation Authority; Mr. Paul Skoutelas—Skoutelas—excuse me, Mr. Skoutelas—Deputy Executive Director, Port Authority of Allegheny County; Mr. Vaughn Whisker, President, Pennsylvania Association of Community Transportation.

A very distinguished panel, and Mr. Jenkins, your full statement will be made a part of the record. And so, if you would go ahead and proceed at this point.

TESTIMONY OF HAROLD C. JENKINS, EXECUTIVE DIRECTOR, CAMBRIA COUNTY TRANSIT AUTHORITY, JOHNSTOWN, PA, ACCOMPANIED BY VICKIE SHAFFER, GENERAL MANAGER, TRI-STATE TRANSIT AUTHORITY, HUNTINGTON, WV; KEVIN ABBEY, PRESIDENT, PENNSYLVANIA ASSOCIATION OF MUNICIPAL TRANSPORTATION AUTHORITIES GENERAL MANAGER, CENTRE AREA TRANSPORTATION AUTHORITY, STATE COLLEGE, PA; PAUL SKOUTELAS, DEPUTY EXECUTIVE DIRECTOR, PORT AUTHORITY OF ALLEGHENY COUNTY, PITTSBURGH, PA; AND VAUGHN WHISKER, PRESIDENT, PENNSYLVANIA ASSOCIATION OF COMMUNITY TRANSPORTATION, ERIE, PA

Mr. JENKINS. Thank you very much. My sincerest thanks to Congressman Bud Shuster and Congressman Murtha for the opportunity to represent the interest of mass transit before this hearing. I also want to express my thanks to the Committee for holding this hearing out in the hinterland, where public transportation roots go

very deep. We are very honored to have you here in Cambria County.

I believe that my appearance here this afternoon is perhaps the most crucial one of all, for never has the role of public transit in America taken on more importance than the role it is about to assume as we move towards the 21st century. And, as members of the Public Works and Transportation Committee, your role in helping to shape the destiny of mass transit in this nation during this crucial period is of paramount importance. And my role—if I may be so presumptuous—is to shed some light on why you should be giving mass transit priority attention as you develop your strategy on the reauthorization of the Surface Transportation Act.

Why is public transit at a critical juncture? If the events in the Middle East during the past six weeks have done nothing else, they have served to illuminate America's need to develop more sensible energy and transportation policies and directions. When our energy, economic and transportation choices are wholly dependent on the might of our Armed Forces, it is time to rethink those choices.

All but lost in the public debate over fuel prices and suggestions for conserving fuel was the solution that could make the biggest contribution—public transit. Using public transportation is among the best ways to conserve energy and should be at the top of the list of national priorities. Unfortunately, at a time when public transit should be assuming a more important role, we are fighting as never before just to keep our financial heads above water. And the higher fuel prices pushing rider demand up have already pushed fuel prices up considerably for transit agencies and the rest of the communities, making all operations more costly.

I know that every one of you are under a considerable amount of pressure to solve the growing deficit problem. The Mideast debacle only makes your choices more difficult. Because of the increased budgetary pressure, there will undoubtedly be needs that go unmet. But, a need that should not go unmet is federal support of public transit.

Public transit will be an important part of moving people to their jobs and helping to keep the economy viable. Public transit will also be important in helping to alleviate an oil price shock or an oil shortage.

Now, is definitely not the time to think about reducing the federal transit budget. In fact, now may be the time to look at an increased federal transit budget to meet national needs. Much to his credit, Secretary of Transportation Sam Skinner has spoken about just such a need. During an August 19 television interview, Mr. Skinner tied national energy conservation efforts to more federal funding for mass transit, along with encouragement of more local funding. I think Secretary Skinner is on the right track.

With respect to your immediate plans for the development of a strong framework on which to base the reauthorization of the Surface Transportation Act, I believe several important points are worthy of your consideration.

The first point is closely aligned with my previous comments with respect to increased funding for mass transit. It simply calls for increased recognition by the Congress that you cannot continue

to impose new federal regulations on us without assuming some additional responsibility for assisting us in paying for the costs associated with implementing these regulations.

We are already facing increased passenger loads due to the international crisis, thus exerting increased pressure on our operating budgets for the purchase of not only more fuel, but more expensive fuel. This fuel has to be stored in conformance with the new federal underground storage regulations—another substantial burden on our operating budgets. New federal clean air regulations, which will soon require the purchase of cleaner, more expensive alternative fuels which must be burned in engines capable of burning alternative fuels—more expensive engines.

And, our buses are now being operated by drivers who are covered by the new federal drug and alcohol testing regulations—regulations which have already cost my transit agency over $10,000.

Therefore, what we are facing, Congressmen, is the financing of increasingly expensive transit service operated by drug-tested drivers who will drive buses powered by more expensive engines, which are fueled by very expensive cleaner fuel, which is stored in environmentally safe, but expensive, storage tanks.

I do not mean to be cynical. I believe that most of these federal regulations have merit, as I do many of the other federal mandates which govern transit. But, someone has to eventually pay the piper, and it certainly cannot be done within the fiscal constraints already proposed by UMTA for consideration by this Committee. Which leads me to my next point.

The Urban Mass Transportation Administration's proposal for adoption by the Public Works Committee calls for various changes to the reauthorization act, some of which are laudable, and others which must receive close scrutiny by your Committee prior to their possible adoption.

One proposal calls for the complete elimination of federal operating assistance, replacing it with a fund called transit capital. Although formula grants under this category would continue to be available for some operating expenses, we are not certain that this concept will meet the operating needs of transit providers. It is important to maintain operating assistance at a level which encourages the growth of ridership in order to promote energy conservation, reduce vehicle pollution, congestion management and development of a sound national transportation policy.

We also must question the wisdom of the UMTA proposal to reduce the federal share for all grants to a 60/40 match. If this proposal is incorporated into the legislation, it will be devastating for both large and small Section 9 transit systems, as well as for the Section 18 rural transit systems. Most of us are currently up against the wall in efforts to obtain sufficient local funding to match existing federal matching ratios. In fact, two of the municipalities which provide local match funding for the Cambria County Transit Authority are already classified as distressed communities by the Commonwealth of Pennsylvania. Therefore, reducing the federal share would only compound this problem immensely, all at a time when transit's role in this country's economic future is taking on increased significance.

Therefore, I am asking your Committee to consider the merits of ignoring the UMTA call for changing the match. In addition, I think it is imperative that you give serious consideration to the benefits of proposing a seven cent per gallon increase in the federal gas tax earmarked specifically for transit. Transit must have a dependable, predictable source of funding upon which to build the mobility plan previously mentioned.

Another major point for consideration is the UMTA proposal to transfer responsibility for administering the Section 9 program to the states for all transit systems under 200,000 in population. The small Section 9 transit systems are unanimous, in our opinion, that such a move would only add to our current budget woes.

The state management of the Governor's apportionment would only create another layer of bureaucracy and provide extremely difficult cash flow problems for all grantees.

Thus, we urge you to let well enough alone. The UMTA staff have traditionally demonstrated a high degree of proficiency in administering the Section 9 program. To quote an old adage, "If it is not broke, do not fix it."

However, one UMTA proposal, in my opinion, has considerable virtue. It calls for authorization for the expansion of the transit research program, with an emphasis on hands-on research activities. The cornerstone of this effort would be the creation of a Cooperative Transit Research Program, modeled after the National Cooperative Highway Research Program. A steering committee of transit industry representatives would be appointed by the Secretary to receive proposals for specific research projects to be pursued.

This type of effort has long been a goal of the transit industry as a way of solving problems of national interest because it involves operators at all levels. I agree with UMTA that the size of the research program should be tied in with the size of the overall UMTA program in order to provide sufficient research funding.

Finally, I would be remiss in my comments if I did not emphasize the continuing need to provide sufficient resources for this country's rural transit programs. There is a growing awareness that rural areas account for at least one-third of all the people who can be considered transit dependent. The results of the enactment of the Section 18 rural transit program in 1978 has clearly demonstrated that mobility needs are not only real, but extensive in rural America. Yet, despite the growth of rural transit systems under the Section 18 program, only about one-tenth of the basic transportation needs of an isolated and transit-dependent population are being met. At the same time, overall federal transit investment has dropped to less than one-half of what it was ten years ago, figured in constant dollars.

Therefore, we need to not only spend down the current surplus in the mass transit account, but we must expand the transit assistance program to encompass the needs of our rural and urban populations who are becoming increasingly dependent on public transit.

Although my comments today reflect the needs of transit as seen through the eyes of a small transit system operator, they also reflect in large part the aspirations of most of the members of the national public transit community. However, in the event that I did not do justice to some of their specific goals, I have attached to

my statement the comments of the American Public Transit Association, the Community Transit Association of America and the Pennsylvania Association of Community Transportation.

In addition, I want to end my remarks with several brief comments concerning the legislation which established America's Industrial Heritage Project for a local nine-county area. This legislation provided for the designation of existing state roads into a system of industrial heritage routes—another term for scenic byways. The National Park Service, in conjunction with the Penn DOT and county tourist promotion agencies, has done an admirable job in planning these heritage routes in the nine-county area to focus attention on the region's premier heritage attractions. We believe that this heritage route plan could serve as a national model. Therefore, we are urging your support of the national scenic byways program in the 1991 highway bill. Scenic byways have tremendous potential with minimum capital investment.

The America's Industrial Heritage Project has implemented an economic monitoring system to measure the projects and economic impact in the region over the next few years, which will include heritage routes as a component. The success of this project has been a genuine partnership between government and the private sector. Each serves clear rules with specific responsibilities. We view scenic byways similarly with specific federal, state and private sector roles. The federal role, at a minimum, should include technical and financial assistance. The coordination of state and federal agency Scenic Byways Program would also be best served at the national level.

In closing, let me state our strong support for a scenic byways element in the 1991 highway bill. A national system of designated scenic and historic routes is simply long overdue. On behalf of the Cambria County Transit Authority, I thank you for the opportunity to express my views on these vital issues involved in transit reauthorization.

I will be happy at the end of our panel's remarks to answer any of your questions.

Mr. MINETA. Very well. Thank you very much, Mr. Jenkins. The submitted statements of all the panel members will be made a part of our official record of the Committee. And, I know that members would like to make verbal statements, so Ms. Shaffer, would you like to start off with some verbal remarks.

[The prepared statement of Mr. Jenkins appears on p. 3022.]

Ms. SHAFFER. I would just like, as a West Virginia resident, to let the Committee know that the interests of this area of Pennsylvania expressed by this panel and both on the highway side and the transit side in the course of the day are very critical to us. We support the testimony I have heard today. We have much in common with this area. We are all a part of the Appalachian Trail down the road. And, those of us in West Virginia appreciate all of your hard work, the leadership that Mr. Shuster has given in mass transit in particular. And, we support your activities and are available for any information you may need beyond that.

Mr. MINETA. Very well.

Mr. Kevin Abbey, President of Pennsylvania Association of Municipal Transportation Authorities.

[The prepared statement of Ms. Shaffer appears on p. 3073.]

Mr. ABBEY. Thank you, Mr. Mineta. I am here today to represent our statewide transit association, in addition to representing in Congressman Clinger's district the transit authority just in the valley to the east of us in State College.

I would like to underscore Mr. Jenkins' comments with one or two simple points. I believe it is important for members of this panel to stress the fact that as we see it, public transportation is on the bubble right now as we look to the future. And, I say that because there are so many issues that dominate the headlines in our every day lives wherein mass transportation has a larger role to play than it currently plays.

Clearly, the recent events in the Mideast and the associated price shock for petroleum products that all of us have faced bring mass transit into the equation now more than ever. I would simply like to say that as you look to the reauthorization of the transit program and the highway program, we are entering the post-interstate era, and it is clearly a time when public transportation in both urban areas and in rural areas need a stronger federal participation in the partnership necessary to do what we want to do in the future.

Thank you.

Mr. MINETA. Very well. Thank you very much, Mr. Abbey.

Mr. Paul Skoutelas.

[The prepared statement of Mr. Abbey appears on p. 3015.]

Mr. SKOUTELAS. Good afternoon, Mr. Chairman and members of the Committee. I am very pleased to have the opportunity to speak to you for a few moments this morning. I will keep my remarks very brief just to touch on a few thoughts which I think are pertinent to your efforts in the reauthorization.

First, I would like to share with you that we firmly believe that the partnership has existed for the past 25 years. Federal, state and local governments has been a success. We have witnessed in Allegheny County and in the city of Pittsburgh over the past decade a new light rail system to busways, a system that is very responsive to the constituents and to the taxpayers. All across this country, we have seen the same kinds of things—new systems sprouting, new services. Mr. Chairman, just two weeks ago, I had the good fortune of visiting your fine city, San Jose, and got to see and ride first-hand the light rail system you have built there. Those are just shining examples, we believe, of what is happening all across this country and are starting to make a difference.

The second thought is that transit is an investment and should not be considered just an expenditure. Too often, we look at the budget implications and say, "Can we afford this?" However, there are so many benefits to transit. Studies have been done which show that for every dollar that is put into the infrastructure for roads, for highways for mass transit results in greater investment by the private sector, greater return on private capital. And, that is a thought that I think you need to consider very closely as you consider the reauthorization.

Third, that as we approach the new century, we have an opportunity to shape and to make the quality of life in this great country of ours what we want. And we believe with all the pressing

issues of air quality, of congested highways and roads, of deteriorating bridges, of mass transit that needs to play a larger role, we have an opportunity to really make a dent in this whole problem that faces our country. Transit is an important solution in that. We believe we can demonstrate that with the benefits we have shown. And, we believe that if you make a wise investment many, many dollars will return back.

Another point is that we believe that the public sentiment and public awareness is growing every day for public transit. Not only for more services, but for the investment that it requires. A recent poll done by Market Strategies, Inc. found that over 66 percent of those people surveyed responded that they would be willing to pay more for gasoline—up to 7 cents a gallon more for gasoline—if, in fact, they could get in return improved highways, improved mass transit. We believe that the signals are becoming louder and that people are understanding what is at stake here.

We would like also to make a point that with transit comes economic development and growth. In Pittsburgh right now, we are in the midst of a major expansion of our international airport, which will double the size of its capacity to handle air traffic in the next two years. The Greater Pittsburgh International Airport is a major traffic generator and economic generator for the Pittsburgh area and for the region. We, right now, are trying to secure funding for an airport busway to service that new airport. And, we believe that has implications far beyond Allegheny County, but into this entire region, through the area of Johnstown, even Altoona, for people that come to Pittsburgh and want to take part in the opportunities for travel that we offer.

Mr. Chairman, with that, I would just again close by saying that we appreciate all your past support. Ask you please carefully to deliberate on the reauthorization. Transit needs your support. And we believe with your support, we can make a difference and improve the quality of life in this country. Thank you.

Mr. MINETA. Very well. Thank you very much, and please give our regards to Mr. Millar.

Mr. Vaughn Whisker, who is the President of the Pennsylvania Association of Community Transportation, as well as the Paratransit Administrator for the county of Erie.

[The prepared statement of Mr. Skoutelas appears on p. 3079.]

Mr. WHISKER. Thank you very much, Mr. Chairman, Mr. Shuster, members of the distinguished Committee.

I have two very quick points to make. Number one is community transportation provides services to those who are beyond the route—fixed route service. Or, due to the ravages of age or disability, are unable to use those services. I ask your support for Section 16(b)(2) for capital equipment for our kind of services to provide that kind of transportation for the elderly and disabled. I ask you also to provide provisions that enable governmental bodies to have access to those funding sources. In many areas of this country, it is the governmental bodies—counties, cities, the like—which provide this kind of transportation, and they are not now eligible for the funding from Section 16(b)(2), but they are the only bodies which provide this kind of service.

The second point I would like to make is to echo the statements made by many here supporting economic development and the key to roads in that economic development. I am one who came from Congressman Shuster's district, was born and raised in Bedford, Pennsylvania from a family that was there from Colonial times. And, I was forced to move from Bedford because there was no industry. There was no employment. And, I would like those who follow behind that live in these communities to have—excuse me—employment and the transportation that enables those goods and services to move across our nation.

Thank you.

[The prepared statement of Mr. Whisker appears on p. 3091.]

Mr. MINETA. Thank you very much, Mr. Whisker.

Let me ask the panel, first of all—and maybe, Mr. Jenkins, you could respond to this—APTA has called for a seven cent increase in the gasoline tax in order to support the transit support that APTA has outlined to us. Do you think the residents in respective areas represented by this panel would be supportive of that kind of an increase in gasoline tax?

Mr. JENKINS. I thought—I think that the residents of our area here, including Pittsburgh, Philadelphia and throughout the rest of the Commonwealth of Pennsylvania, would support that, as long as the dollars would be used and go to mass transit and highways as they are earmarked for. The problem that the constituency has out there is we are building up a $7 billion surplus in there that is being used through smoke and mirrors to say that we have a lesser deficit than what we have. If that money could be guaranteed that it would be used, the people of Pennsylvania would support an increased gas tax. It has got to be used, though, for highways and mass transit and not put in the bank.

Mr. MINETA. The—given limited financial resources, and if we are unable to, let us say, increase the authorized amounts that would be spent on some of these programs and shake loose the funds from the trust funds that are there, would flexibility—would flexibility—if there are provisions put into the legislation to allow movement of one category to—movement of money from one category to another as determined by, let us say, local or state—at the state or local government—state and local being, let us say, council or governments at a local level. Would that—would that help?

Mr. JENKINS. We would—we would support that issue if there are strict rules and regulations written into the use of those funds. We think that money that is earmarked for public transit should go to public transit. We think that money that is earmarked for highways should go to highways. We would have to look at that very seriously and consider it very closely before we would agree to intermingling of the funds. Of course, we would like all the highway money——

Mr. MINETA. What about high occupancy lanes or van pooling or these kinds of things that may increase ridership in terms of——

Mr. JENKINS. They are the exact issues that we in the public transportation field must address and we have to address and we have—we have to address it with the highway interests hand in hand. We can and will make provisions that these high occupancy lanes for the Pittsburgh area—the airport access——

Mr. MINETA. Van pooling.

Mr. JENKINS. Van pooling. Forcing folks to use their automobile in the congested areas. That has to be done.

Mr. MINETA. Mr. Skoutelas.

Mr. SKOUTELAS. Yes, Mr. Chairman. Thank you for the opportunity to comment on that. As we see it, there are two—three major components to what we are seeking in the reauthorization. The first is to provide adequate funding to reinvest in our services. In the 1980s, we saw a decline. Transit today is receiving half the dollars in real terms than it did in the early 1980s. We need to be at about $6½ billion a year just to reinvest in existing infrastructure and services for mass transit.

Beyond that, we see a very necessary component of capacity expansion. And by that, we mean, that at the regional level, there ought to be funds made available so that decision makers can decide what mix of highway improvements, what mix of transit improvements are best for that area. And we, as an industry are very willing to compete on that basis, provided that, first, the needs—the basic needs of transit are provided for, and then, we will compete with highway interests, I think, to balance the best needs of the transportation system in the area.

And third, we need an aggressive research and development program. Transit is no different than any other business in the sense that it needs to look for better ways and improved methods of delivering its services. And for too long, we have not spent enough money on research and development. We would like to see that done more aggressively in the new authorization.

Mr. MINETA. Let me ask, while you are answering right now. You know, we take a lot of public money. This is going to apply more to urbanized areas, rather than the rural areas. But, we take a lot of public monies and put it into transit. There is a lot of value created, you know, for Jones Construction Company who owns the land or some other development company. Is there some way that as we pour that money into public transit and lay out a light rail system or a heavy rail system and, all of a sudden, someone is profiting from this great land value increase at public investment source—is there some way of recapturing that increased value so we can take that money and then pour it back into some more expansion of transit facilities, and do you know of anywhere this might have been used?

Mr. SKOUTELAS. Well, I think it is happening every day maybe in different form than one envisions. For example, in Pittsburgh, right above one of our subway stations, we have just received a proposal and I just approved it for a $500 million complex to consist of two hotels, two major office towers and department stores. Now, that is going to generate jobs. It is going to generate new revenues for the city of Pittsburgh and Allegheny County that, in turn, are going to put money in people's pockets who are then going to spend that. So, I think we are capturing that by the investments that we are making. You can do it in a very formal sense by taking money off the top of a developer and saying this is going to go back to a specific improvement. But, I think the other way that it is happening is by its own natural course in the marketplace, and we are

seeing that in Pittsburgh. I think we are seeing it across the country.

Mr. MINETA. Suppose we say, on the other hand, that was—I do not know, let us say $412 million of money coming out of the highway trust fund that goes to PAT that does—that makes that happen. Should we at the federal level be recapturing part of that so that maybe we take that and use it for further improvements in the system?

Mr. SKOUTELAS. I think that has merit. I think what you can do is to encourage us to work closer with the private developments and the local governments to see just what can be done in an area. That encouragement, I think, could use a stronger hand from the Federal Government.

Mr. MINETA. Very well. Thank you.

Mr. JENKINS. Two areas, Mr. Mineta, that I would like to point out to you. One is the state of Alaska has those exact provisions in their laws in their impact fees. As they develop their complexes, they are charged then, the developer is charged whatever it costs that transit authority. My sister city, State College, Congressman Clinger's district, has one of the best planning modules for developments—future developments that must go through the transit authority and be approved by the transit authority prior to them getting permits to construct major shopping centers——

Mr. MINETA. So, being recaptured at the local level. The question is whether we can recapture it at the federal level or if there is any purpose in that.

All right, let me ask Mr. Shuster.

Mr. SHUSTER. I have no questions. Thank you very much.

Mr. MINETA. Mr. Roe.

Mr. ROE. I do have a question, Mr. Chairman, and an observation. Mr. Whiskers raised a very good point when he made the point that he had lived in Bedford, I believe, and was really unable to stay there to pursue your career pursuits because of opportunity from an economic point of view. If I may share with you and a number of our colleagues here today, the substance of the testimony—and rightfully so, at least in large measure—has been directed towards the point of view of how we grow, what we do and how we apply these public investments, and then we provide—well, of course, we provide resources for people. But also, it increases our economic value and all of those issues we talked about. Your point about building a hotel over the top of the subway station and so forth and so on. But, I think getting back to Mr. Whisker, there is a very important point we ought to consider as we are pursuing this legislative process, and that would go to the point as follows.

The fastest, largest growing demographic population in the country is between 75 and 85 years old. The fact of the matter is if you look at the graying of America, for the want of a better phraseology, we are developing a great, much more rapid increase in our senior citizen population. And, I am wondering if we are not—if we are not mixing the pickles when we use the word "mass transit." Mass transit does not really apply to rural areas in the same sense as people connote mass transit to be in New Jersey or in Philadelphia or, you know—New York or whatever.

And it seems to me that if we want to keep our population—our senior population in our respective areas where they want to stay, so they do not have to go to Florida or some other particular "senior community," that there ought to be consideration, I would think, and an overall national policy that starts to provide flexibility so that where the rural areas of our country are involved, that they do not have to be nailed down to particular predetermined ideas as to what mass transit or how we get people in the flexibility of living in their homes in Pennsylvania or New Jersey without moving someplace where there is a "popular connotation of mass transit."

It is a long way around. But, I would think we ought to start to develop an idea that the transportation system ought to be for the use of people and the needs of people and what their needs are, rather than what other people and public officials assume that they are going to move people around faster. I do not think that the movement of people necessarily reflects what the quality of life is or the flexibility or the freedom that the American people would have, such as the great state of Pennsylvania. And I would hope that we would start to give that some consideration as we unfold a national transportation policy.

Mr. WHISKER. If I might make a comment on that, Mr. Roe. The state of Pennsylvania has, indeed, moved in that way in that it has established a lottery that will benefit senior citizens or older Pennsylvanians. Fixed route transportation systems provide free transit for those age 65 and older on non-peak periods. It provides up to 90 percent of the cost per trip for those persons who are going on door-to-door services. And in these days, if you cannot get there—if you are a senior citizen and cannot get there, the service might as well not exist for you. You cannot get—grocery stores do not deliver. Doctors do not come to homes any more. And, perfectly productive members of society that have been aged—and my parents in your district, Congressman Shuster, both of them had to give up driving because my father and mother can no longer see. And systems like mine in Bedford deliver that transportation for them door to door with the help of the lottery, and they would like to have 16(b)(2) funds.

Mr. ROE. Would the gentlemen yield. In New Jersey, we also passed the special senior citizen tax on Atlantic City gambling. And let me tell you something, it has been helpful to a degree. But, the public policy then begins to emerge on the basis—I do not mean this disrespectful to you—that because we have a tax on the gambling in Atlantic City, that that is the total solution to the transportation system of the elderly. And therefore, that money is allocated and the rest do not pay any attention. I would think that we would start to look to the issue without being too loquacious right now and say that as we develop a new system of transportation in the country—which Mr. Mineta is vigorously working on and our friend, Bud Shuster, and others who are here, and certainly, Jack—there ought to be a system that recognizes people's needs and is oriented to people. We should not have people respond to some popular connotation of what somebody else thinks the transportation system should be all about. That is the point I wanted to make for the record.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you, Mr. Roe.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. I have no questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. I just want to thank the panel for their testimony, in particular, my constituent, Kevin Abbey, who is running a very fine system in State College. And the emphasis that I think needs to be made is that people say, "Well, why do you support mass transit because you are a rural Congressman?" I think we made the point very clearly here today that mass transit is perhaps, in some cases, more important in rural areas than it is in major cities because people just do not have access and cannot get around at all without it in some instances. I commend you on that.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. Good job.

Mr. MINETA. Mr. McEwen.

Mr. MCEWEN. I have nothing.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Nothing.

Mr. MINETA. Mr. Lightfoot.

Mr. LIGHTFOOT. No, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Nothing.

Mr. MINETA. Mr. Hancock.

Mr. HANCOCK. Nothing.

Mr. MINETA. Well, let me thank the panel. Let me ask one quickee. You call for an increase in research and development funds. Any kind of research and development projects you have in mind that might be helpful to local transit agencies as to what kind of R&D ought to be pursued?

Mr. JENKINS. Congress has taken the first step when they reauthorized the bill last time by giving us a bus testing facility. And hand in hand—thanks to Congressman Shuster—yes, absolutely. But, hand in hand that goes with bus testing, as they test these new components—as they test these things, then the manufacturers and the industry in whole should have the opportunity to develop new products, to develop cheaper and better ways that we could have air brakes, that we could have tires lasting longer, reduce the weight of the bus so, rather than getting three miles to the gallon, that we might be able to get seven or eight miles per gallon. So hand in hand with the testing facility would go research and development not only done in the Altoona area, but done by the industry and by the government.

Mr. SKOUTELAS. Mr. Chairman, if I may just add to that. The other notion being that as well, we believe we need to work much closer with the domestic supply industry for transit. What we have seen over the years is that the industry in the United States has disappeared, and that has moved offshore. There is expertise. There is a labor force here that can provide many, many commodities for transit, and we need to do more research that ties in the domestic suppliers with the needs of the operators, and that is what we would like to see emphasized.

Mr. MINETA. Very well. Thank you very, very much. Yes.

Mr. ABBEY. One key area there, in particular, with research and design, I think, that is on the cutting edge within our industry has to do with disabled transportation. With the new Americans with Disabilities Act, we need to look at ways to better design and equip vehicles to handle disabilities. Better ways to secure and safety provide for the myriad number of wheelchair apparatus and look at a whole range of options that get us away from simply large buses with hydraulic lifts.

Mr. MINETA. Very well. Thank you very, very much.

Mr. JENKINS. Thank you for the opportunity to appear in front of you.

Mr. MINETA. I would now like to call Mr. Terry L. Daughenbaugh, Chairman of the Transportation Committee for Eastern Westmoreland Development Corporation, who is being accompanied by Brother Norman Hipps, who is the Provost at St. Vincent College.

TESTIMONY OF TERRY L. DAUGHENBAUGH, CHAIRMAN, TRANSPORTATION COMMITTEE FOR EASTERN WESTMORELAND DEVELOPMENT CORP., LATROBE, PA, ACCOMPANIED BY RALPH SCALISE, CHAIRMAN, EWDC AND BROTHER NORMAN HIPPS, PROVOST AT ST. VINCENT COLLEGE

Mr. DAUGHENBAUGH. I am Terry Daughenbaugh, General Manager, Primary Operations and Engineering at Latrobe Steel Company. Today, I am here in a capacity, however, as Chairman of the Transportation Committee of Eastern Westmoreland Development Corporation, EWDC, a non-profit corporation. With me today are Ralph Scalise, who is Chairman of EWDC, and Brother Norman Hipps, who is an Executive Board member and a member of the Transportation Committee of EWDC.

The goal of EWDC is the retention and expansion of the present business and industry, while attracting new business and industry, enhancing new business formations in the eastern region of Westmoreland County. After extensive input from the community, economic development was determined to be the top priority in EWDC's strategic plan.

Grants from four local foundations, the Timken Foundation, the McFeely-Rogers Foundation, the Philip M. McKenna Foundation and the Katherine Mabis McKenna Foundation, of $400,000 to underwrite the strategic plan provided the initial support for EWDC. Over $50,000 in additional funds were solicited in 1990 for the first year of EWDC membership. The Laurel Valley Expressway has been determined to be one of the top priorities of EWDC because of the strength of existing businesses and industry and the potential for business and industry expansion in our area.

Joining us in the effort to promote the development of the expressway are the Department of Planning and Development of Westmoreland County, the Southwestern Pennsylvania Regional Planning Commission and the Central Westmoreland County Development Corporation.

The Laurel Valley Expressway is a proposed 12-mile highway that would link the New Stanton/Mt. Pleasant area, the junctions of I-70, the Greensburg Bypass, the Pennsylvania Turnpike and Route 119 with the Westmoreland County Airport, the planned in-

dustrial airpark and eastern Westmoreland County. It is proposed that the expressway eventually continue on to Route 22, giving north-south and east-west access to eastern Westmoreland County.

We envision this as a two-phase process. The first phase would be a 12-mile stretch from the New Stanton/Mt. Pleasant area to the Latrobe area, tying our region to the county's major existing highways and the Pittsburgh hub of activities and vastly improving access for the large number of industries located here. These industries rely on truck transportation, which is severely limited by inadequate access from all directions. Most of this traffic is routed through extremely hazardous, limited, congested and densely populated areas of Routes 30, 119, 981 and 982. The Laurel Valley Expressway would take on much of the truck traffic and would help promote safety along the corridor between New Stanton and Latrobe.

Eastern Westmoreland County industries have for many years voiced their need for the expressway. Defense contractors, Latrobe Steel and Teledyne-Vasco are particularly concerned that the roadways be improved in order to ensure adequate access. The expressway would benefit industries in the New Stanton area as well, particularly the Sony Corporation, by essentially moving the Westmoreland County Airport closer to them. Moreover, prospective new industries have emphasized the need for a more safe and efficient road network. The expressway will provide that safety and the road network necessary to make eastern Westmoreland County more attractive to industry.

Tourism offers great potential for our region. We live in one of the most beautiful areas in the United States, with many historical sites, as well as a wide range of outdoor activities. The American Heritage program is being developed in our area. EWDC President, Phil Dymond, is on the county committee. Providing direct access from the turnpike and Route 22 would greatly assist in the effort to promote this project in our region, as well as tourism in general.

By linking the New Stanton/Mt. Pleasant area and eastern Westmoreland County, the expressway would ease congestion on local highways, making them safer, while opening doors to economic development and tourism in eastern Westmoreland County. We need your support. We thank you for your time and interest. Any questions?

Mr. MINETA. Thank you very much, sir.

Brother Hipps, did you wish to——

Mr. HIPPS. Only if there are any particular questions.

Mr. MINETA. All right. Fine. Mr. Scalise.

Mr. SCALISE. I believe there is one comment, I think. Sitting here throughout the day listening to what you are looking for in terms of grassroots support. It has become very evident in listening to all the testimony today, and it is something that EWDC has been very concerned with, is that the basis of all economic development really, really has to do with infrastructure. And the fact that we are short changed in our infrastructure really puts a damper in terms of what we can do. The one issue which everybody seems to address when a crisis comes along is that in order to entice someone new, you want to do something for them.

But, there is a more paramount issue in everybody's backyard. And that issue is to retain those people that we have. If you look at most consultants, they will tell you that economic development in any region, 85 percent of that development would come from within. Fifteen percent would come from without. So, it is essential for us not only to attract new people, but to maintain and help the people we do have expand their facilities to provide the kind of infrastructure that we have so direly been neglected over the years.

Mr. MINETA. A very good point. The estimated cost of these two phases of the proposed Laurel Valley Expressway amount to what?

Mr. DAUGHENBAUGH. Well, Penn DOT has estimated that it would be about $5-15 million a mile. So, you are talking 12 miles for the first link to Latrobe, which essentially gives us about 70 percent of the benefit. And another 12 miles to connect it to Route 22, which would really open the northern corridor.

Mr. MINETA. And, am I correct in that the Pennsylvania Department of Transportation put the Laurel Valley Expressway project on hold some 20 years ago.

Mr. DAUGHENBAUGH. Some 20 years ago.

Mr. MINETA. And what is their position on this project today?

Mr. DAUGHENBAUGH. Well, in 1989, Westmoreland County Planning Department entered into a testimony to the Pennsylvania Transportation Commission hearings, the fact that they supported the need for Laurel Valley Expressway. Our group, EWDC, picked up the project this fall, and we hope to testify—make a convincing testify—testimony to the State Transportation Commission in February or March and get it on the first segment of the state's 12-year plan.

Mr. MINETA. Let us see. Just for my own—let us see, the college is located in——

Mr. DAUGHENBAUGH. In Latrobe.

Mr. MINETA. In Latrobe. And, do I under—let us see—the President of your college, St. Vincent College, is whom?

Mr. HIPPS. His name is Father John F. Murtha.

Mr. MINETA. John F. Murtha. You mean, we have been confusing John F. and John P. all these years?

Mr. HIPPS. I am not sure.

Mr. MINETA. Well, that is great. And, John F. is your——

Mr. MURTHA. Cousin.

Mr. MINETA. Cousin. Great. All right.

Mr. Shuster.

Mr. SHUSTER. I have no questions. Thank you very much.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No questions.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. I just have to say Westmoreland is one of the most congested areas in the entire country, no question about it. Red lights every block. I mean, it is really a problem to get through that area. And, this would be a real boost for economic development.

Mr. MINETA. Mr. McEwen.
Mr. MCEWEN. Nothing.
Mr. MINETA. Mr. Packard.
Mr. PACKARD. Nothing.
Mr. MINETA. Mr. Lightfoot is—Mr. Hastert.
Mr. HASTERT. Nothing.
Mr. MINETA. Mr. Hancock.
Mr. HANCOCK. Nothing.
Mr. MINETA. Well. I am sorry—Daughenbaugh?
Mr. DAUGHENBAUGH. Daughenbaugh.
Mr. MINETA. Daughenbaugh, Brother Hipps and Mr. Scalise, thank you very, very much for your being here today.

I would now like to call Mr. Joe Kirk, Mon Valley Progress Council, Mon/Fayette Expressway Association.

Sir, if you would go ahead and proceed in your own fashion.

TESTIMONY OF JOSEPH P. KIRK, MON VALLEY PROGRESS COUNCIL, MONESSEN, PA

Mr. KIRK. Thank you very much, Mr. Chairman. First, I would like to thank Congressmen Murtha and Shuster for the opportunity to come before this Committee and holding it here outside of the beltway, as it was said.

Again, my name is Joe Kirk. I am Executive Director of a corporate-sponsored community and economic development corporation called the Mon Valley Progress Council, and also Chairman of an association formed to move—to advance the Mon Valley/Fayette Expressway. We have representatives in that expressway association from Allegheny County, the counties of Allegheny, Washington, Fayette and Monongalia County in West Virginia.

Really, in the interest of time, I will really just touch on a couple of points of my testimony. And indeed, I wish to speak not just about the expressway, but about the broader highway issues that the expressway really represents.

The Mon Valley/Fayette Expressway is a proposed 65-mile highway. You have a map of it in my testimony. It is an economic development highway that would connect Morgantown to Pittsburgh and serve the economically devastated Mon Valley region. And, we have heard a lot about economic difficulties and challenges facing all of western Pennsylvania. The collapse in major industry affected the Mon Valley the most in the loss of over 100,000 jobs in the 1980s. It certainly is making some recovery, but not that much. The expressway is intended to be a cornerstone for the economic revitalization of this area.

Currently, there is $57 million worth of construction on the project, another $35 million in Fayette County to begin this fall. Planning is underway for the entire project that is to be completed by the mid 1990s. It is a cooperative effort of the Pennsylvania Turnpike Commission, Pennsylvania Department of Transportation and the West Virginia Department of Transportation.

Indeed, it is a project that was developed as a result of the efforts of this Committee in the 1987 Surface Transportation legislation.

The expressway, however, is like many other projects. It can only be completed with a comprehensive funding plan. And, that has to

include funding from the state, from the federal and really, from the local level. Tolls will play an important role in the development of such highways, and specifically, in the development of the Mon Valley/Fayette Expressway.

What we propose is a special targeted federal program for toll roads. Such an initiative is consistent with the Administration's National Transportation Report and really represents a logical step from the 1987 act. The plan is briefly stated on page two of my testimony and also further on, there is a more detailed description.

If I might just read from the second full paragraph of the second page.

> If implemented, the proposal would provide direct federal support for 75 percent of the 35 percent federal aid approved under the toll road provisions of the 1987 act. This would represent about one-quarter of the cost of the project. And the nine percent difference would be supported by the state. Funding for this initiative could be supported by an increase in the authorization level of the Federal Highway Trust Fund. The amount of the increase would be based on the financial needs of such projects and reflective of fiscal realities. Each state would be permitted to designate one toll road under the program.

Again, that is consistent with the 1987 act. "Funds would be allocated on a competitive basis."

I really would just like to conclude in saying that, again, the issue here is not just one project. You have heard needs probably amounting over two billion dollars in terms of local highway needs. We really need to look at more innovative ways to utilize federal funds in a targeted way for the development of needed highway systems. And I thank you very much.

[The prepared statement of Mr. Kirk appears on p. 3040.]

Mr. MINETA. Thank you very much, Mr. Kirk, and also for your innovative approach in terms of the thought about this new program. Under your proposed priority highway link program, are you confident that the Mon Valley/Fayette Expressway would be designated as a Pennsylvania toll project, or would other toll facility proposals within the state compete with it for priority designation under this proposed program?

Mr. KIRK. Others would compete. And the only confidence that we would have is that the project is desperately needed, and efforts have been made to advance it, and indeed, it was designated under the 1987 act. I might add that this is just an initial thought that there would only be one per state. But, I think the idea of how many per state is a matter of further discussion.

Mr. MINETA. And, do you have any idea as to how much would be—how much increased expenditures there would have to be from the highway trust fund to support this kind of a priority highway link?

Mr. KIRK. Again, in terms of just the expressway, just to give an example, you are looking at approximately a $300 million expenditure over a five-year period, to represent about a quarter of the cost of the project. I would think that you would need to have—assuming that that is about the average cost of this type of project—that amount available. Again, not necessarily for every state, but on a competitive basis. So, maybe ten times that amount available.

Mr. MINETA. Thank you very much.

Mr. Shuster.
Mr. SHUSTER. No questions. Thank you.
Mr. MINETA. Mr. Roe.
Mr. ROE. No questions, Mr. Chairman.
Mr. MINETA. Mr. Hammerschmidt.
Mr. HAMMERSCHMIDT. No questions.
Mr. MINETA. Mr. Clinger.
Mr. CLINGER. Thank you.
Mr. MINETA. Mr. Murtha.
Mr. MURTHA. No questions.
Mr. MINETA. Mr. McEwen.
Mr. MCEWEN. No questions.
Mr. MINETA. Mr. Packard.
Mr. PACKARD. Nothing.
Mr. MINETA. Mr. Lightfoot.
Mr. LIGHTFOOT. No, sir.
Mr. MINETA. Mr. Hastert.
Mr. HASTERT. Nothing.
Mr. MINETA. And Mr. Hancock.
Mr. HANCOCK. Nothing.

Mr. MINETA. Well, again, Mr. Kirk, thank you very, very much and thank you for giving the thought that you did in preparing your statement.

At this time, we have concluded the agenda of the Subcommittee on Surface Transportation. And again, I would like to thank Congressman Jack Murtha for the invitation to come to Ebensburg and to the Municipal officials for allowing us to use these very, very fine facilities.

What we are doing here is typical of what we are attempting to do in other parts of the country. Because what happens is that we may legislate, the Federal Highway Administration or the Urban Mass Transit Administration may run the program. But let us face it, you folks are the ones who are going to have to live with the programs and make them work. And our—the only way we will really know how to formulate this legislation—because we are at the beginning of the legislative pipeline; you are at the other end of the legislative pipeline—is to get this kind of input as to what has to be going into the formulation of this legislation. So, this is a very, very important facet of it, and so, we do appreciate all of you taking time from your own busy schedule to prepare your testimony and to make the presentation to us today.

Again, thank you very, very much for your attention and for your attendance here. The Subcommittee is adjourned.

[Whereupon, at 1:45 p.m., the Subcommittee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

Pennsylvania Association of Municipal Transportation Authorities

PAMTA

PENNSYLVANIA ASSOCIATION OF MUNICIPAL TRANSPORTATION AUTHORITIES

Kevin C. Abbey, PAMTA President

TESTIMONY

before

Surface Transportation Sub-Committee

of the

House Public Works and Transportation Committee

Good Morning panel members. My name is Kevin Abbey. I serve as the General Manager of the Centre Area Transportation Authority in State College, Pennsylvania, and am here today representing the Pennsylvania Association of Municipal Transportation Authorities (PAMTA), as its elected President. PAMTA is the State of Pennsylvania's professional association of public transportation properties. PAMTA has 34 member transportation authorities, ranging in size from the four (4) vehicle systems in DuBois and Shenango Valley to SEPTA, the operating authority in the City of Philadelphia and the suburban Southeast Pennsylvania area.

INTRODUCTION

Long recognized as the "Keystone State" because of its central importance to the commerce, culture, and character of early America, Pennsylvania recognizes the vital role its transportation network plays in its survival. Whether moving goods to market, employees to work sites, customers to retail centers, patients to doctors, students to school, or friends to friends,

transportation is one of Pennsylvania's "vital signs".

In both urban and rural areas throughout the Commonwealth, public transportation keeps cities and towns moving. Pennsylvania is a particularly "transit-intensive" state. Its 22 urban and 19 rural public transportation systems serve 48 of the 67 counties where nearly 94% of the entire Commonwealth's population resides. In 1988/89, transit provided 465 million passenger trips. Every county in the Keystone State has some form of specialized, publicly-subsidized transit service for senior citizens.

RE-AUTHORIZATION

Few issues are as important to the economic and societal well-being of the Commonwealth and the nation as the re-authorization issue before us now. As we enter the post-Interstate era, it is time to boldly chart our course into the future, setting a forward-looking agenda for transportation that allows us to efficiently husband resources to provide efficient and comprehensive mobility, rather than reacting to problems in the future that will be much more difficult and costly to address then than they are now.

As the Administration and the Congress move towards re-authorization, it is imperative that we recognize the importance of the nation's transportation network in general and public mass transportation in particular. Mass transportation has the ability to help address some of the prominent issues in the public arena at this time. Economically, socially and en-

vironmentally, mass transit is a integral part of a national strategy to lower Vehicle Miles Traveled (VMT) and promote a more efficient national transportation system. As such, it deserves the full support of the nation and of its elected officials.

Over the past eight years, however, the federal government has slowly, yet surely, backed away from mass transit. This policy, has been nothing short of disastrous. Many public transportation properties now find themselves dealing with operating deficits, aging fleets and declining revenues in a time when demand for their services grows stronger. It is a contradiction to call for major re-investment in the transportation infrastructure and at the same time erode government support.

When the government took a lead in the 1960's and 70's in encouraging the needed growth of public transportation, many leapt to join that call. Local and state governments took up their shares of the burden, and dedicated professionals across the land implemented the programs and brought mobility to the people. The federal government provided the incentives, both monetary and otherwise, to encourage expansion and innovation. Now, the funds are being cut and transit is left scrambling. The government challenged us and we answered their call. The government must also pledge itself to the protect the national commitment to mass transportation.

That is why the issue of re-authorization is of such enduring importance. The shape of a re-authorization program will determine how transit will address the needs of the people

and whether such assistance will be full and complete, or faint and half-hearted. Naturally, as a transit manager, I would like to see transit adequately funded and the needs for expansion and rehabilitation met. As a public policy maker, I believe we must act as wise guardians of the public weal and invest in our future now. The alternative is to abdicate our responsibility and leave it to our posterity to spend billions and even trillions to do the necessary work we shun today.

GUIDELINES AND RECOMMENDATIONS

The Pennsylvania Association of Municipal Transportation Authorities (PAMTA) proposes the following guidelines and recommendations for the earnest consideration of the sub-committee as it moves towards re-authorization. With a firm belief that we are united in the principle of a strong and effective transportation infrastructure, these guidelines and recommendations are proposed in the spirit of cooperation and with the desire to provide a view of the needs of those in the front lines of our national transportation network.

The first and foremost guideline must be a firm and resolute commitment to re-investment in mass transportation by the federal government. Funding must be restored to levels (in real dollars) of the early 1980's and then increased to levels necessary to effectively deal with the needs of rehabilitation and operating assistance. This can best be accomplished be identifying a dependable, dedicated source and transit funding. This dedicated source of funding would support an adequate program of operating

assistance for all transit systems and could provide funds to help transit effectively implement the guidelines of the Clean Air Act and the Americans With Disabilities Act.

Beyond the critical area of adequate federal funding, the government must also supply policies which encourage the use of public transit. Elimination of federal tax policies which discourage the use of public transit should be a top priority, and tax incentives should be given to private sector investment in public transportation. Weight should also be given to policies which require integration of transportation investments and land-use decisions. In sum, the federal government, recognizing the critical importance of public transit in the national transportation network, must be become "transit-friendly" and restructure its priorities to support this needed service.

In keeping with these guidelines, and with a firm belief in an effective partnership between the federal government and private enterprise in the promotion of public transit, PAMTA proposes the following recommendations to the Sub-Committee for its consideration and that of the full House Committee:

1. Federal investment in surface transportation should be increased as a critical first step in the re-structuring of portions of the federal program.

2. An immediate seven cent per gallon increase in the federal gas tax should be enacted to support needed transit and highway investment, with the entire federal fuels tax made

permanent concurrent with re-authorization. Full revenues from this tax should be committed annually. This would help meet the at least $11 billion needed annually ($6.5 billion for essential re-investment and $4.5 for capacity expansion) that our transportation system requires.

3. The concept of transit should be expanded to include all multi-occupancy , shared-ride services. Federal policy should reduce growth in vehicle miles traveled (VMT) while accomodating increased passenger miles, thus serving people instead of vehicles.

4. Regional decision-making over the use of federal transportation funds should be enlarged and strengthened. Local areas, in keeping with national policy, are in the best position to deploy resources to meet regional needs.

5. A stronger, multi-modal approach to planning, funding and policy-making is needed to enable local areas to exercise flexibility in the most cost-effective use of resources to meet regional goals.

6. In order to deal with the transportation challenges confronting us, federal support must be dependable and predictable. Dedicated funding and formula allocations are methods by which this can be achieved. Transit's substantial contributions to mandated federal actions and national goals more than justify these commitments.

7. Federal transportation policies and programs should require closer integration of transportation investments and land use decisions, to provide a favorable environment for the use of high-occupancy, shared-ride vehicles.

8. Federal operating assistance must be preserved and enhanced for all sizes of transit systems to assure adequate maintenance and effective operation of the transit capital investment.

CONCLUSION

It is our belief that by adhering to these guideline and recommendations, the re-authorization process will produce a bill which adequately addresses the transportation needs of our nation and allows transit to best serve the people in the most reliable and cost-effective manner. PAMTA stands ready, as always, to do its part in the implementation of a strong and vital transportation program for the nation. We ask only for the means to most effectively implement these policies. Give us the tools and we will do the job.

I thank the sub-committee for its attention to these issues.

TESTIMONY

OF

HAROLD C. JENKINS

GENERAL MANAGER

CAMBRIA COUNTY TRANSIT AUTHORITY

BEFORE THE

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

U.S. HOUSE OF REPRESENTATIVES

SEPTEMBER 17, 1990

EBENSBURG, PENNSYLVANIA

Thank you very much for your kind introduction. And, my sincerest thanks to Congressman Bud Shuster for the opportunity to represent the interests of mass transit before this hearing on the reauthorization of the Surface Transportation Act. I also want to express my thanks to the Committee for holding this hearing out in the hinterland, where public transportation roots go very deep. We are very honored to have you here in Cambria County.

During my fourteen years as general manager of the Cambria County Transit Authority, I've made numerous presentations before various Congressional committees on behalf of many issues affecting public transit.

But, I believe that my appearance here this afternoon is perhaps the most crucial one of all. For never has the role of public transit in America taken on more importance than the role it is about to assume as we move towards the 21st century. And, as members of the Public Works and Transportation Committee, <u>your</u> role in helping to shape the destiny of mass transit in this nation during this crucial period is of paramount importance. And my role, if I may be so presumptuous, is to shed some light on <u>why</u> you should be giving mass transit priority attention as you develop your strategy on the reauthorization of the Surface Transportation Act.

Why is public transit at a critical juncture?

38-253 O—91——96

If the events in the Middle East during the past six weeks have done nothing else, they have served to illuminate America's need to develop more sensible energy and transportation policies and directions. When our energy, economic, and transportation choices are wholly dependent on the might of our armed forces, it is time to rethink those choices.

All but lost in the public debate over fuel prices and suggestions for conserving fuel was the solution that could make the biggest contribution: public transit. Using public transportation is among the best ways to conserve energy, and should be at the top of the list of national priorities.

With the Middle East in crisis, U.S. energy and transportation policy is getting a wake-up call. Today, when energy concerns are uppermost in our minds, we must resolve to ensure a strengthened public transit industry.

Unfortunately, at a time when public transit should be assuming a more important role, we are fighting as never before just to keep our financial heads above water. And, the higher fuel prices pushing rider demand up have already pushed fuel prices up considerably for transit agencies, making all operations more costly.

I know that every one of you are under a considerable amount of pressure to solve the growing deficit problem. The Mideast debacle only makes your choices more difficult. Because of the increased budgetary pressure, there will undoubtedly be needs that go unmet. But, a need that should <u>not</u> go unmet is federal support of public transit.

Public transit will be an important part of moving people to their jobs, and helping to keep the economy viable. Public transit will also be important in helping to alleviate an oil price shock or an oil shortage.

Now is definitely not the time to think about reducing the federal transit budget.

In fact, now may be the time to look at an increased federal transit budget to meet national needs. Much to his credit, Secretary of Transportation Samuel Skinner has spoken about just such a need. During an August 19 television interview, Mr. Skinner tied national energy conservation efforts to more federal funding for mass transit, along with encouragement of more local funding.

I think Secretary Skinner is on the right track. As you consider the arguments for transit reauthorization, we are asking you to keep public transit on solid financial footing. The recent Middle East crisis forces us to look to the future of personal mobility in this country and to make some difficult choices. We need to keep federal funding for public transit intact, and put a plan into place to increase support in the future. And, it's important to keep in mind that this plan is vitally important regardless of the short term consequences of our involvement in the Mideast. We must develop long range plans which reduce considerably our chronic dependance on foreign supplies of energy.

With respect to your immediate plans for the development of a strong framework on which to base the reauthorization of the Surface Transportation Act, I believe several important points are worthy of your consideration.

The first point is closely aligned with my previous comments with respect to increased funding for mass transit. It simply calls for increased recognition by the Congress that you cannot continue to impose new federal regulations on us without assuming some additional responsibility for assisting us in paying for the costs associated with implementing these regulations.

We are already facing increased passenger loads due to the international crisis, thus exerting increased pressure on our operating budgets for the purchase of not only more fuel, but more expensive fuel. This fuel has to be stored in conformance with new federal underground storage regulations, another substantial burden on our operating budgets. And, new federal clean air regulations will soon require the purchase of cleaner, more expensive alternative fuels which must be burned in engines capable of burning alternative fuels. More expensive engines.

And our buses are now operated by drivers who are covered by the new federal drug and alcohol testing regulations, regulations which have already cost my transit agency over $10,000.

Therefore, what we are facing, Congressmen, is the financing of increasingly expensive transit service, operated by drug tested drivers who will drive buses powered by more expensive engines which are fueled by very expensive cleaner fuel which is stored in environmentally safe, but expensive, storage tanks.

I don't mean to be cynical. I believe that most of these federal regulations have merit, as do many of the other federal mandates which govern transit. But, someone has to eventually pay the piper! And, it certainly can't be done within the fiscal constraints already proposed by UMTA for consideration by this Committee. Which leads me to my next point.

The Urban Mass Transportation Administration's proposal for adoption by the Public Works Committee calls for various changes to the reauthorization act, some of which are laudable, and others which must receive close scrutiny by your Committee prior to their possible adoption.

One proposal calls for the complete elimination of federal operating assistance, replacing it with a fund called "transit capital". Although formula funds under this category would continue to be available for some operating expenses, we are not certain that this concept will meet the operating needs of transit providers. It is important to maintain operating assistance at a level which encourages the growth of ridership in order to promote energy conservation, reduced vehicle pollution, congestion management, and the development of a sound national transportation policy.

We also must question the wisdom of the UMTA proposal to reduce the federal share for all grants to a 60/40 match. If this proposal is incorporated into the legislation, it will be devastating for both large and small Section 9 transit systems, as well as for the Section 18 rural transit systems. Most of us are currently up against the wall in efforts to obtain sufficient local funding to match existing federal matching ratios. In fact, two of the municipalities which provide local match funding for the Cambria County Transit Authority are already classified as distressed communities by the State of Pennsylvania. Therefore, reducing the federal share would only compound this problem immensely, all at a time when transit's role in this country's economic future is taking on increased significance.

Therefore, I am asking your Committee to consider the merits of ignoring the UMTA call for changing the match. In addition, I think it is imperative that you give serious consideration to the benefits of proposing a seven cent per gallon increase in the federal gas tax earmarked specifically for transit. Transit must have a dependable, predictable source of funding upon which to build the mobility plan previously mentioned.

Another major point for consideration is the UMTA proposal to transfer responsibility for administering the Section 9 program to the states for all transit systems under 200,000 in population. The small Section 9 transit systems are unanimous in our opinion that such a move would only add to our current budget woes.

The state management of the governor's apportionment would only create another layer of bureaucracy and provide extremely difficult cash flow problems for all grantees.

In Pennsylvania, the current state management of the Section 18 program typically results in delays of up to four months for the receipt of payments for capital purchases or operational expenses. But under the existing Section 9 arrangement, it typically takes only one day for the electronic transfer of funds. Most of our contracts require payment within 30 days of receipt of the goods or services. But, if the state assumes responsibility for administering the Section 9 program, the inevitable delays will force us to borrow money to pay our bills, a completely untenable situation considering the major fiscal problems we already face.

Thus, we urge you to let well enough alone. The UMTA staff have traditionally demonstrated a high degree of proficiency in administering the Section 9 program. To quote an old adage, "if it ain't broke, don't fix it!"

However, one UMTA proposal has, in my opinion, considerable virtue. It calls for authorization for the expansion of the transit research program, with an emphasis on "hands on" research activities. The cornerstone of this effort would be the creation of a Cooperative Transit Research Program, modeled after the National Cooperative Highway Research Program. A steering committee of transit industry representatives would be appointed by the Secretary to receive proposals for specific research projects to be pursued.

This type of effort has long been a goal of the transit industry as a way of solving problems of national interest because it involves operators at all levels. I agree with UMTA that the size of the research program should be tied in with the size of the overall UMTA program in order to provide sufficient research funding.

Finally, I'd be remiss in my comments if I didn't emphasize the continuing need to provide sufficient resources for this country's rural transit programs. There is a growing awareness that rural areas account for at least one-third of all the people who can be considered transit dependent. The results of the enactment of the Section 18 rural transit program in 1978 has clearly demonstrated that mobility needs are not only real, but extensive in rural America. Yet, despite the growth of rural transit systems under the Section 18 program, only about one-tenth of the basic transportation needs of an isolated and transit-dependent population are being met. At the same time, overall federal transit investment has dropped to less than one-half of what it was ten years ago, figured in constant dollars.

Therefore, we need to not only spend down the current surplus in the Mass Transit Account, but we must expand the transit assistance program to encompass the needs of our rural and urban populations who are becoming increasingly dependent on public transit.

Although my comments today reflect the needs of transit as seen through the eyes of a small transit system operator, they also reflect in large part the aspirations of most of the members of the national public transit community. However, in the event that I did not do justice to some of their specific goals, I have attached to my statement the comments of the American Public Transit Association, the Community Transit Association of America, and the Pennsylvania Association of Community Transportation.

On behalf of the Cambria County Transit Authority, I thank you for the opportunity to express my views on the vital issues involved in transit reauthorization. I will be happy to respond to any questions you may have.

ANALYSIS OF UMTA REAUTHORIZATION PROPOSAL

UMTA proposes to authorize $4.5 billion annually for the federal transit program. DOT may reduce this level to $4 billion in the first year, increasing to $4.5 billion by the end of the authorization.

> This program level falls far short of APTA's proposal for an $11 BILLION annual program level. Secondly, the authorized level historically has been higher than the actual annual appropriation. Finally, this proposal has not been approved by OMB, which may order further cuts.

UMTA proposes to reduce the federal share of discretionary capital expenditures and formula assistance to 60% of costs. The current federal share under the discretionary program is 75%. The current federal share of formula capital expenses is set at 80%.

> We need a greater investment in existing capital investments and expansion of transit service to meet growing demands. A reduced federal share will make it extremely difficult to build needed transit projects in areas where transit could stimulate economic development. A reduction in the federal share further increases the incentive for localities to choose highway projects, now funded at 90% federal share, over transit projects when making local spending decisions.

UMTA proposes to reverse the funding sources for the discretionary and formula programs. Under the proposal, the Section 3 discretionary program would be funded with general revenues and the Section 9 capital program would be funded from the Mass Transit Account of the Highway Trust Fund.

> Over the last ten years the program funded with general funds has consistently been subject to a disproportionate share of funding cuts relative to the authorized program levels. Unless the program can be designed to ensure that the authorized levels are maintained, the effect of this proposal may be to reduce funding for new capital projects and bus purchases.

UMTA proposes to permit the use of transit funds for highway projects and vice-versa. An area would be required to have a "balanced local approach" for transit before transit funds could be used on a highway project.

> Beyond ensuring that an area have a "balanced local approach" for funding transit, some effective means of

guaranteed adequate federal funding for transit must be provided. Regardless of state and local funding sources for transit, the state political environments in some states would almost surely result in the majority of federal funds being spent for highway projects, at the expense of worthy and necessary transit projects.

UMTA proposes to eliminate operating assistance but define as an allowable "transit capital" expense outlays for "materials and supplies." If an area's operating cap was not equal to "materials and supplies" a hold-harmless provision would be established to provide operating assistance up to the area's current operating cap.

Operating assistance is badly needed by all transit operators. It is not certain that the "materials and supplies" concept would meet the operating needs of transit providers and unclear how small systems within large urban areas and others would be "held-harmless" from the loss of operating aid. It is important to maintain operating assistance at a level which encourages the growth of ridership in order to promote energy conservation, reduced vehicle pollution, congestion management, and the development of a sound national transportation policy.

9-10-90
cjj

KEY POINTS FOR SURFACE TRANSPORTATION REAUTHORIZATION

Public transit must play a greater role in the nation's transportation infrastructure. Future transit needs require a comprehensive federal financial strategy that includes reliable and predictable funding to permit participation by all state and local governments.

APTA urges the federal government to:

* Increase federal transit spending to at least $11 BILLION annually, $6.5 BILLION for essential reinvestments and $4.5 BILLION for capacity expansion. A seven cent per gallon increase in the federal gas tax earmarked for transit would provide a dependable, predictable source of funding.

* Give metropolitan areas greater flexibility in the use of federal transportation funds;

* Eliminate federal tax policies that discourage transit use and private investment in transit facilities.

* Support an adequate program of operating assistance for all transit systems.

* Expand federal support for transit-related research development, training, and human resources, and provide for direction of the program by transit industry officials.

* Provide federal funding for effective implementation of federal mandates such as those established under the Clean Air Act Amendments and the Americans with Disabilities Act.

* Promote transportation policies which require integration of transportation investments and land-use decisions.

In addition, here is a list of APTA's 13 principles to guide the reauthorization:

1. The federal investment in surface transportation should be substantially increased and, with these increases, parts of the federal program should be substantially restructured.

2. The concept of transit should be broadened to include all high-occupancy, shared-ride services. The goals of federal policy should be to serve diverse travel needs, to reduce growth in vehicle miles traveled (VMT) while accommodating increased passenger miles of travel, and to serve people rather than vehicles.

3. Regional decision-making authority over the use of federal transportation funds should be enhanced and strengthened. Local

areas should be able to deploy resources to meet regional goals in a way that is consistent with national policy.

4. There should be a stronger multi-modal approach to planning, funding, and decision-making. This will enable local areas to make appropriate trade-offs among many local and regional objectives, to make more cost-effective use of resources, and to reduce counterproductive federal restrictions.

5. Federal support should be more reliable and predictable. This can be accomplished through greater reliance on dedicated funding sources, formula allocation, and multi-year federal funding commitments. The costs associated with mandated federal actions, and transit's substantial contributions to the achievement of other national goals, justify increased support from all sources.

6. Increase reliance on a predictable formula using factors that better reflect transit needs.

7. Substantial additional funding should be provided for transit to fully carry out the national goal of significantly increasing the provision and use of high-occupancy, shared-ride services.

8. An immediate motor fuels tax increase should be enacted to support needed transit and highway investment, and the entire federal fuels tax made permanent concurrent with reauthorization of the surface transportation assistance act. Full revenues from the tax should be committed annually.

9. The federal tax code should be revised to promote private investment in transit, and to eliminate the taxation of employer transit subsidies and other disincentives to transit use.

10. Federal transportation policies and programs should require closer integration of transportation investments and land use decisions, to provide a favorable environment for increased use of high-occupancy, shared-ride services. Other federal policies should incorporate the same objective. Unless local development practices and policies are consistent with basic federal transportation goals, direct federal investment will be ineffective.

11. Expand federal support for transit research, development, and training, and ensure adequate direction of the program by transit industry officials.

12. Federal operating assistance for all sizes of transit systems is essential to assure adequate maintenance and effective operation of the transit capital investment.

13. Federal policies and mandates add to the costs of transit operations and, accordingly, federal funding should be provided to meet these requirements.

Summary of UMTA Reauthorization
Proposal: Salt Lake City
July 23, 1990

Note: At the recent General Manager's Seminar in Salt Lake City, representatives of UMTA summarized a proposal for reauthorization of the transit program. It was emphasized at the time of this summary that the proposal, outlined below, had not been approved by the Secretary of Transportation or the Office of Management and Budget.

Program Level: The basic proposal was for a five-year reauthorized program at an annual level approaching $4.55 billion to be funded by the following sources of revenue: (1) funds from the Mass Transit Account of the Highway Trust fund at a level of $2.8 billion annually based on a five-year spend down of the trust fund and annual gas tax receipts from the transit penny; and (2) general fund appropriations authorized at $1.75 billion annually.

Program Structure: The Section 3 discretionary program, Section 9 formula program for urbanized areas, and Section 18 formula program for small urban and rural areas would be retained, however, with major changes in source of funding, federal share, and eligible uses for the funds as follows:

--Section 3: The discretionary program for bus and rail would be funded by appropriations from the general fund. Eligible projects would include new starts, extensions, bus projects, and a metropolitan action program designed to respond quickly to unique mobility problems in an urbanized area. The federal share would be reduced to 60 percent. Rail modernization projects would no longer be funded under the discretionary program; instead, the rail modernization funds would be distributed via the Section 9 formula.

--Section 9: The formula program for urbanized areas would be funded "primarily" from a spend down of the Mass Transit Account of the Highway Trust Fund and from new gas tax receipts. The formula would remain the same, however, the incentive tier based on passenger miles would be eliminated. The federal share would be reduced to

60 percent. Operating assistance would be eliminated, but "transit capital" would be defined to include "materials and supplies." If an area's operating cap was not reached by "materials and supplies," there would be a hold-harmless provision permitting operating assistance up to the level of an area's operating cap. Rail modernization funds would be distributed according to the rail factors in Section 9.

--Section 18: The formula program for small urban and rural areas would be continued and funded "primarily" from the Mass Transit Account of the Highway Trust Fund. The approach to operating assistance under Section 18 would be the same as that described above for the Section 9 program.

Flexibility: One of the most important features of the new program is flexibility, meaning that transit formula funds could be used for highway projects. An area would have to have a "balanced local approach" for funding transit before transit funds could be used on a highway project. In addition, highway funds from the urban and rural program could also be made available for transit projects.

Designated Recipients: For areas over 200,000, the current designated recipients would continue to be the grant recipient. For areas under 200,000, the funds would go to the states for allocation to transit systems. Localities would have to concur before the states could commit any transit funding to highway projects.

Research: The research program would be expanded and additional funding for research would be authorized with an emphasis on "hands on" research activities.

Statement by Robert D. John, Vice President of the Route 219 Assn.

September 16, 1990

Honorable members of the Surface Transportation Subcommittee of the Public Works and Transportation Committee - Welcome to Cambria County and U.S. Route 219 Country.

In the 1950's, a few good men envisioned a four-lane limited access highway from Buffalo, New York, to Bluefield, West Virginia, along the U.S. Route 219 Corridor. In recent years, the focus on the Corridor has narrowed to the 252 miles from Canada to the Maryland State Line where the road connects with Maryland 48, Interstate 70 and 270 to Baltimore and Washington, D.C. On the north, U.S. Route 219 connects with Canada's Queen Elizabeth Highway and Toronto. Thus, U.S. Route 219 is an international highway, connecting Toronto, Canada and Washington, D.C.

Thirty-seven of the 65 miles in New York State and 55 of the 187 miles in Pennsylvania are now limited access, 4-lane modern highways as are the Canadian and Maryland sections.

The U.S. Route 219 Corridor in Pennsylvania suffers tremendously from a lack of 4-lane limited access highways. In fact, when the interstate highway system was designed, Johnstown and Cambria County was one of only 7 areas in the United States with a population over 50,000 that was not on the interstate system. The others, for your information, included: Witchita, KA, Altoona and Lancaster, PA., Fresno, CA., San Angelo, TX., Witchita Falls, TX., and Atlantic City, NJ.

The completed construction of U.S. Route 219 as a limited access highway will give the area of West Central Pennsylvania the long-term economic stability the region has never known. Without modern highways, there can be no economic expansion.

Transportation infrastructure investment is most often justified based on its effects on short-term job creation, the fact that spending has not kept pace with economic growth, or shortfalls in physical conditions relative to some emergency or safety standard. While real, these arguments miss the vital long-term economic role transportation serves by a developed economy. Recent studies prepared by Apogee Research have shown that a significant increase in federal highway spending will lead to a $250 annual increase in productivity for each American worker and $3200 within 20 years, a very impressive figure.

The recent Free Trade Agreement between Canada and the United States could have a great economic impact on the Route 219 Corridor.

The United States and Canada currently exchange more goods between themselves than any 2 nations in the world. Canada is the fastest growing market for the United States.

Buffalo, NY, the northern terminus of the U.S Route 219, stands to become the gateway city linking the worlds two largest trading partners. It is only natural that this trade agreement will cause hundreds of millions of dollars of goods to flow up and down U.S. Route 219.

The agreement makes it mandatory to re-build Route 219 as a four-lane limited access highway which will open up West Central Pennsylvania as a new economic "boom area" to produce the goods that Canadians will be demanding from our country.

There is no greater reason for a new U.S. Route 219 than the Canada-United States Free Trade Agreement.

U.S. Route 219 has had more studies conducted on it that any highway in Pennsylvania. The studies all point to the fact that the construction of a limited access four-lane highway will have a tremendous economic benefit to West Central Pennsylvania - in fact, probably no other area in the United States would benefit more from the construction of a highway.

Thank you for your past support of U.S. Route 219 and taking time out of your busy schedules to visit our area.

TESTIMONY
BEFORE THE
SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
HOUSE PUBLIC WORKS COMMITTEE
MONDAY, SEPTEMBER 17, 1990
EBENSBURG MUNICIPAL BUILDING
EBENSBURG, PA

BY
JOSEPH P. KIRK
EXECUTIVE DIRECTOR
MON VALLEY PROGRESS COUNCIL
EASTGATE ELEVEN
MONESSEN, PA
(412) 684-3381
AND CHAIRMAN
MON/FAYETTE EXPRESSWAY ASSOCIATION

MR. CHAIRMAN AND MEMBERS OF THE SURFACE TRANSPORTATION SUBCOMMITTEE OF THE HOUSE PUBLIC WORKS COMMITTEE, MY NAME IS JOSEPH KIRK. I AM EXECUTIVE DIRECTOR OF A CORPORATE SPONSORED, COMMUNITY AND ECONOMIC DEVELOPMENT NOT FOR PROFIT CORPORATION CALLED THE MON VALLEY PROGRESS COUNCIL AND CHAIRMAN OF THE MON/FAYETTE EXPRESSWAY ASSOCIATION. THE PROGRESS COUNCIL, WHICH IS CELEBRATING IT'S 25TH ANNIVERSARY, SERVES A REGION LOCATED TWENTY-FIVE MILES SOUTH OF THE CITY OF PITTSBURGH. THE MON/FAYETTE EXPRESSWAY ASSOCIATION IS A COALITION OF LOCAL LEADERS COMMITTED TO THE TIMELY DEVELOPMENT OF THE EXPRESSWAY PROJECT. AN ATTACHED MAP PROVIDES THE SERVICE AREA OF THE PROGRESS COUNCIL AND THE LOCATION OF THE MON VALLEY/FAYETTE EXPRESSWAY.

IT IS A PLEASURE TO HAVE THE OPPORTUNITY TO APPEAR BEFORE THIS COMMITTEE ON AN ISSUE OF SUCH PROFOUND IMPORTANCE AS HIGHWAY DEVELOPMENT.

AS MEMBERS OF A COMMITTEE THAT DEAL WITH IMPORTANT ISSUES OF TRANSPORTATION, YOU ARE ACUTELY AWARE OF THE DIRECT RELATIONSHIP BETWEEN ECONOMIC VIABILITY AND THE AVAILABILITY OF A MODERN HIGHWAY SYSTEM. IN ECONOMIC DEVELOPMENT EFFORTS, THE PRESENCE OF HIGHWAY SYSTEMS THAT PROVIDE ACCESS TO MARKETS IS A PREREQUISITE FOR THE LOCATION OF INDUSTRY.

FOR THE MON VALLEY REGION, THE DEVELOPMENT OF A NEW HIGHWAY LINK IS ESSENTIAL FOR THE ECONOMIC REVITALIZATION OF OUR REGION. THE DEVASTATING INDUSTRIAL DECLINE OF OUR REGION IN THE 1980'S IS WIDELY KNOWN. ALTHOUGH PROGRESS HAS BEEN MADE IN PROVIDING EMPLOYMENT FOR THE 100,000 PEOPLE WHO LOST JOBS, UNEMPLOYMENT IN THE STEEL VALLEY COMMUNITIES STILL IS IN THE DOUBLE DIGIT RANGE.

DESPITE A DEEP COMMITMENT TO OUR OWN HIGHWAY PROJECT, MY PURPOSE IN APPEARING BEFORE THIS COMMITTEE IS TO SPEAK TO A MUCH BROADER HIGHWAY DEVELOPMENT ISSUE. THE 1987 SURFACE TRANSPORTATION ACT TOLL ROAD PROVISION DEVELOPED UNDER THE LEADERSHIP OF THIS COMMITTEE SET INTO MOTION A POLICY THAT CAN HAVE A PROFOUND IMPACT ON THE DEVELOPMENT OF NECESSARY ECONOMIC DEVELOPMENT HIGHWAYS SUCH AS THE MON VALLEY/FAYETTE EXPRESSWAY. THE RECENTLY ISSUED NATIONAL TRANSPORTATION POLICY REPORT SPEAKS OF THIS ON PAGE 118 BY STATING THAT THE ADMINISTRATION WILL DEVELOP LEGISLATION CONSISTENT WITH THE PRINCIPLE TO "ALLOW GREATER USE OF TOLL FINANCING ON FEDERAL AID HIGHWAYS". TESTIMONY PROVIDED BY SOUTHWESTERN PENNSYLVANIA AND WEST VIRGINIA GROUPS AT HEARINGS IN THE DEVELOPMENT OF THIS POLICY IS CITED ON PAGE 25 OF THE REPORT.

IN OUR EFFORTS TO ENCOURAGE THE NEXT STEP IN THE PROMOTION OF TOLL ROADS WE HAVE CONSULTED WITH A VARIETY OF HIGHWAY USER GROUPS, ELECTED OFFICIALS AND CONSTRUCTION ASSOCIATIONS INCLUDING THE INTERNATIONAL BRIDGE, TUNNEL AND TURNPIKE ASSOCIATION, THE AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION, ASSOCIATED BUILDERS AND CONTRACTORS, CONTRACTORS ASSOCIATION OF WESTERN PENNSYLVANIA AND AMERICAN TRUCKING ASSOCIATION, INC. I AM NOT SUGGESTING THAT WE ARE REPRESENTING A POLICY POSITION OF THESE GROUPS. HOWEVER, IT IS FAIR TO REPORT THAT OUR PROPOSAL HAS EARNED THE INTEREST OF THE AFOREMENTIONED.

OUR PROPOSAL TO PROMOTE NEW ECONOMIC DEVELOPMENT HIGHWAY LINKS IS BASED ON THREE PRINCIPLES.

* A LIMITED FEDERAL TOLL ROAD STRATEGY ENHANCES THE OPPORTUNITY TO DEVELOP PRIORITY ECONOMIC DEVELOPMENT LINKS.

* THE FEDERAL HIGHWAY ADMINISTRATION SHOULD PLAY AN ACTIVE ROLE IN DIRECTING THE DEVELOPMENT OF SUCH ROADS CONSISTENT WITH THE PROVISIONS OF THE 1987 ACT.

* THE 1991 REAUTHORIZATION OF THE SURFACE TRANSPORTATION ACT SHOULD INCLUDE SPECIFIC, DIRECT FINANCIAL SUPPORT FOR THE IMPLEMENTATION OF A TOLL ROAD POLICY.

GENTLEMEN, WHAT WE ARE PROPOSING IS A TARGETED FEDERAL INITIATIVE TO PROMOTE THE DEVELOPMENT OF IMPORTANT NEW HIGHWAY LINKS CONSISTENT WITH THE NATIONAL POLICY REPORT OBJECTIVE OF "INCREASING THE LOCAL SHARE OF FEDERAL AID FOR TRANSPORTATION" (PAGE 44). THE PRIORITY HIGHWAY LINK PROGRAM WE PROPOSE WOULD BE TARGETED TO THE CONSTRUCTION OF NEW LIMITED ACCESS INTERSTATE GRADE HIGHWAYS. ATTACHED TO MY TESTIMONY IS A COPY OF THE DETAILS OF OUR PROPOSAL.

IF IMPLEMENTED THE PROPOSAL WOULD PROVIDE DIRECT FEDERAL SUPPORT FOR 75% OF THE 35% FEDERAL AID APPROVED UNDER THE TOLL ROAD PROVISION OF THE 1987 ACT. THIS WOULD REPRESENT 26% DIRECT FEDERAL ASSISTANCE FOR PRIORITY HIGHWAY LINKS. THE 9% DIFFERENCE WOULD BE SUPPORTED THROUGH EXISTING HIGHWAY TRUST FUND APPROPRIATIONS TO THE STATES. FUNDING FOR THIS INITIATIVE COULD BE SUPPORTED BY AN INCREASE IN THE AUTHORIZED LEVEL OF THE FEDERAL HIGHWAY TRUST FUND. THE AMOUNT OF THE INCREASE WOULD BE BASED ON THE FINANCIAL NEEDS OF SUCH PROJECTS AND REFLECTIVE OF FISCAL REALITIES. EACH STATE WOULD BE PERMITTED TO SEEK DESIGNATION FOR ONE TOLL ROAD UNDER THE PROGRAM. FUNDS WOULD BE ALLOCATED ON A COMPETITIVE BASIS.

ALTHOUGH WE FEEL THAT A TOLL ROAD STRATEGY IS THE MOST EFFECTIVE MEANS TO DEVELOP ECONOMIC DEVELOPMENT HIGHWAY LINKS, CONSIDERATION SHOULD BE GIVEN TO BROADEN PARTICIPATION THAT WOULD PERMIT OTHER INNOVATIVE PUBLIC/PRIVATE FINANCING TECHNIQUES. THE USE OF SUCH INNOVATIVE TECHNIQUES IS REPEATEDLY REFERRED TO IN THE NATIONAL POLICY REPORT.

FOR OUR REGION THE PRIORITY HIGHWAY LINK PROGRAM WOULD PROVIDE A MEANS TO ENSURE THE TIMELY COMPLETION OF THE MON VALLEY/FAYETTE EXPRESSWAY. ON A NATIONAL LEVEL THE PROPOSAL WOULD PLACE THE FEDERAL GOVERNMENT IN A LEADING ROLE FOR THE IMPLEMENTATION OF INNOVATIVE TECHNIQUES THAT PROMOTE A WIDE RANGE OF FINANCING STRATEGIES NECESSARY FOR THE DEVELOPMENT OF NEW HIGHWAYS.

AGAIN, I THANK YOU AND WELCOME YOUR QUESTIONS.

Proposed
Federal Toll Road Initiative
for the 1990's

The establishment of the Toll Road Demonstration Program under the 1987 Surface Transportation Act represented a significant milestone in the promotion of toll road facilities. The seven states designated under the program (later expanded to nine) were permitted for the first time to utilize Federal Highway funds for up to 35% of the cost of one toll road project per state designated by the Governor. Projects were also approved by the Federal Highway Administration.

Policy established through the 1987 Act clearly recognized the importance of toll road facilities in meeting the need for new highways. The 35% funding formula established under the Act also began the transition of the Federal Government to a partnership role on certain highway projects. Conversely this formula requires significant financial participation from states, local governments and the private sector to advance such projects.

Although the 1987 Act established an important policy it fell far short of the mark in the provision of fiscal resources necessary for implementation. The Act created a process where newly established projects have to complete with long term needs in an environment of inadequate fiscal resources. A paper tiger policy will not promote the development of highways essential for relief of congestion, promotion of safety and the provision of essential catalysts for economic development and redevelopment.

Pending legislative action on the renewal of the Federal Highway Program provides an opportune time to develop a truly effective program to promote toll road facilities. The elements outlined below would provide a targeted and measured approach that could be incorporated into the 1992 Surface Transportation Act. The proposed increase in the authorized level of Federal Highway Trust Funds stated below would support toll road projects. The proposed funding formula of 26% would result in a funding ratio of almost 4 to 1 versus current ratios of as low as 1 to 9. As an example, a 500,000 million dollar highway project would require $270,000 less in Federal funds under the proposed toll road initiative.

<u>Proposed Toll Road Initiative</u>

* Expansion of the 1987 Toll Road Provisions to include one project in each of the fifty states.

* Continuation of the process for designation of toll roads established under the 1987 Act.

* Establishment of a funding formula based on 75% of the 35% eligible costs of toll road projects. The program would be supported by an increase in the authorization level of the Federal Highway Trust Fund.

* It is anticipated that the increase in the authorized level would be inadequate to support all projects seeking funding. A task force of toll road agencies would be established to develop a draft criteria for selection of projects and submit their findings to the Secretary of Transportation. Projects would be submitted to the Federal Highway Administration for review and approval.

TESTIMONY BEFORE THE
PUBLIC WORKS COMMITTEE
OF THE
U.S. HOUSE OF REPRESENTATIVES

SEPTEMBER 17, 1990

BY

J.WILLIAM LINCOLN
PENNSYLVANIA STATE SENATOR

My name is Bill Lincoln, I am the Pennsylvania State Senator representing Somerset and Fayette Counties, and it is a great honor as well as an awesome responsibility to appear before the United States House Committee on Public Works today.

The situation surrounding Route 219 has implications for international trade, national productivity and local livlihood. I want to touch briefly on the first two items and concentrate on the third. The Route 219 corridor is a major artery connecting Washington, D.C. with Buffalo, N.Y. and Canada. Both Maryland and New York have recognized its potential and are developing major roads to realize this goal.

The corridor's geographic placement makes it the most viable route to open markets all the way from Canada to the American South. It runs through an area in Pennsylvania which gives graphic proof of the decline of American productive capacity with its closed coal mines, shuttered steel mills, its unemployed and underemployed workers.

The completion of the new Route 220 through Bedford and Cambria Counties has brought with it an explosion in trade, and has demonstrated what we have always known--business and industry gravitates to accessible areas.

Here in Southwestern Pennsylvania we have all the ingredients for a rejuvenation of productive strength.

*****We have a highly skilled workforce, used to and dedicated to hard work.
*****We have a state ready to invest its resources in economic development. In fact, we have already optimized our state dollars in an effort to improve our infrastructure with such programs as PennVest, a revolving loan program to improve water and sewer capacity.
*****We have major universities dedicated to development of high tech industries.
***** We have local support from Chambers of Commerce, citizens

groups and politicians.

*****We have burgeoning recreational facilities already used by residents of Maryland, Virginia and the District of Columbia as well as Pennsylvania. And we have the potential for much more.

*****We have our neighbor Maryland upgrading 40/48 all the way across the state.

But we also have a road which does not support the traffic presently on it and certainly does not beckon future development. It is heavily travelled, windy, hilly, unsafe and inconvenient. Until 219 is upgraded, it will be a bottleneck not only to local traffic, but to increasing trade in the entire northeast.

As U.S. Congressmen, you must necessarily look at the national and international implications of your actions. As a State Senator, my concerns are more parochial. The district I represent is one of great heart but little hope. When Time magazine chose representatives of the working poor to portray in their most recent issue, the only intact family they chose was from western Pennsylvania. And they were good representatives for us--people with old time values of family feeling, hard work, honor and deeply held religious conviction. These are not people who drain our social service system, and they also are not people who have participated in any so-called economic resurgence. The squeeze in which they find themselves is not one of their own making, they are the personal manifestations of a policy of benign neglect of the infrastructure of our heartland, of the diminishing of America's productive capacity.

Roads truly are our hope for the future. They provide one of the best investments I can think of for our federal dollars. Route 219 will open our area to the nation, allowing all the potential we have to be realized.

Pennsylvania has recognized for a long time that this road should be built. In the 1970's and early 1980's, Route 219, like many other projects, was dropped from our 12-year plan because Pennsylvania had borrowed beyond its limit--a problem you can sympathize with I'm sure. We have restored fiscal soundness, put a massive maintenance program in place, and are presently revisiting many of the projects which were dropped in the 70's and early 80's.

This is one of those projects. At this time, I would like to pledge myself and every power at my command to see that it comes to fruition. First, I will be meeting with other state officials and representatives from Somerset County to ensure that the upgrade of Route 219 from Somerset to the Maryland border be included in the first phase of our 12-year plan. Now is definitely the time to give this project the top priority it deserves.

It is clear that PennDOT already realizes its importance. The Department has authorized $500,000 for needs analysis, preliminary

engineering and environmental studies of a segment of 219 around Meyersdale. A consultant will be selected by early next year who will assess the environmental impact, not just around Meyersdale, but for the entire southern corridor from Somerset to the Maryland line.

We feel that the need is great, the resources are in place, and the result will far exceed the cost. We will be ready when you are.

RICHARD H. MAYER
The Tribune-Democrat
September 17, 1990
Public Works Committee

The invitation to testify at this hearing is very much appreciated by this user of local highways for sixty years. Twenty-five of those years have been spent trying to convince politicians that Route 219 needed to be a four-lane highway from the New York line to the Maryland line and preaching that, for the well-being of the Johnstown area, Route 56 should be four-lane from Bedford to Indiana. And there seems to be a lot of interest finally in making Route 22 a four-lane from the Pittsburgh area to Armagh, something that has been needed since the 1950's.

Private citizens don't build highways. Chamber of Commerces don't build highways. Unions don't build highways. Highways are built by government, funded by politicians. When it is time to put a name on a section of highway, it is often named for the politician who had enough clout to get the funding. Hence: The Ed McNally Bridge on Route 219, the Bud Shuster Byway around Everett; the Amos Hutchison Expressway in Westmoreland County.

There doesn't seem to be any politician from our area in state government who has the necessary clout to get local higways funded out of Pennsylvania tax money. As a matter of fact, they continue to vote against increases in the gasoline tax. Because of this problem in the state government, we have to look to the federal government for highway funding.

If nothing else, this hearing should recognize that Congressman Shuster and Congressman Murtha have the necessary clout to finally get some much-needed highways built in this part of Pennsylvania, and the people testifying today should encourage these two gentlemen to get the funding authorized and build the highways.

The interest in better highways for this area is usually encouraged by people and organizations with selfish motives: better highways will make it easier and faster to get our goods and services out to our customers. Or we can get to Pittsburgh or Harrisburg, or Washington or New York faster in our personal automobiles if we have better highways.

Now some of the emphasis has changed. Instead of trying get out of our communities, we need better highways to attract businesses and tourists into our communities. The highways become vital as Johnstown and Altoona and the nine-county Heritage Project try to encourage tourism. The success of the new tourism industry in this community will depend on how easy it is for the tourist to get here. The better the highway into town, the more tourists we will attract.

So, Congressmen Shuster and Murtha. We want highways. Government builds the highways. Government can't build them until you get the funding. You have the necessary influence to pass the funding. Can we count on you to get our highways?

TESTIMONY OF D.C. NOKES, JR.

CHAIRMAN, HIGHWAYS AND TRANSPORTATION COMMITTEE

GREATER JOHNSTOWN CHAMBER OF COMMERCE

September 17, 1990

Committee on Public Works and Transportation

Subcommittee on Surface Transportation

Ebensburg, Pennsylvania

In 1964 a report was issued entitled "What Future Do Our Kids Have Around Here?" The consultant's task was to identify the problems facing the Greater Johnstown Region. I was 10 years old, and one of the kids to whom the report referred. The report identified four primary problems; outward migration of our youth, heavy reliance on steel and coal, chronic high unemployment, and POOR TRANSPORTATION ACCESS TO OUR AREA. Twenty-six years later, these problems continue to exist, and the overriding reason that our economic development continues to be stymied is POOR TRANSPORTATION ACCESS to our region.

Many citizens of our region have toiled long and hard, and continue to work to enhance the economic climate of our region, but the poor highway access to the Greater Johnstown region makes our effort not just difficult, but nearly impossible.

Our economic development representatives have, for years boasted that 50% of the United States population is within 500 miles of Johnstown, Pennsylvania. That's the good news.

However, the bad news is that the proximity of the nation's population does no good at all if we cannot get our products to that population, nor can that population travel to enjoy the tourism, recreational and other opportunities we offer; or to visit to consider economic development sites.

Our region has analyzed and re-analyzed what highway corridor is our top priority; Route 22 to Pittsburgh, Route 219 North and South, or Route 56 to Bedford. I submit that the completion of <u>any</u> corridor is essential to those of us seeking to create economic revitalization and solve the problems identified in 1964, and repeated in many reports thereafter. We must, with your help, and the help of the State of Pennsylvania, address the poor transportation access to our region to be able to look forward optimistically to the next century for the residents of our region, and our next generation of children.

No other problem is identified more often as an impediment to economic growth in our region than poor transportation access. As a representative of our Chamber of Commerce, Johnstown Area Regional Industries, and other groups, we ask that you join in partnership with us to offer our children the opportunity to create a greater future for our region.

Presented by
Representative Thomas A. Tangretti
Westmoreland County
Pennsylvania
House of Representatives

Good afternoon. My name is Thomas Tangretti. I am the State Representative from the 57th legislative district which comprises the city of Greensburg, the county seat of Westmoreland County.

I will be presenting the testimony of my colleague from Westmoreland, the Chairman of the House Transportation Committee, Representative Joseph A. Petrarca. Rep. Petrarca sends his regrets for not being able to attend today's hearing and asked me to thank you for allowing me to present his testimony. With me today is Paul Parsells from Rep. Petrarca's staff. Paul is Executive Director of the House Transportation Committee and will be available to answer any questions you might have.

Testimony of Rep. Joseph A. Petrarca.....
Mr. Chairman, we are beginning a decade which I believe will prove to be the most critical test of our ability as individual states and as a nation to meet our transportation needs. The Persian Gulf crisis has given us a necessary and well timed "slap in the face", reminding us that we will be unable to meet our transportation needs in the 21st century if we do not make critical decisions now.

Pennsylvania is prepared to make those decisions, but we need the help of you in Congress and the Bush Administration. Clearly, we can no longer depend on oil as

38-253 O—91——97

a reliable energy source in the next century. There are alternative fuels available that CAN be produced today that are not only a good substitute for oil, but are beneficial to both the consumer and the environment.

Specifically, compressed natural gas is a fuel which is abundant in supply, burns much cleaner, is less expensive, and most importantly, the technology exists today to utilize it. I bring this to the attention of this subcommittee for your consideration mainly for its potential applications in mass transit, a subject which I would like to discuss in more detail in a moment. My committee has had the opportunity to see this technology at work when we took a ride on a bus which was fueled exclusively by compressed natural gas.

Transit authorities are very interested in this technology but they need help with the initial capital investment. While the operating costs are projected to be low, spending scarce mass transit funds to retrofit buses and to build pumping stations is very costly. If we can help with these start up costs, the long term benefit would be well worth it. This help should also extend to large vehicle fleets such as school buses and ultimately, I believe that we should concentrate our efforts and funding to make alternative fuels, such as natural gas, more accessible to the general public.

One of the critical decisions facing us today as we approach the next century involves mass transit. At a time when the federal government should be encouraging mass transit, it has turned its back on the states. The decision to mask the Federal deficit by refusing to allocate funds from the more than 6 billion dollar Mass Transit Account of the Federal Highway Trust Fund is irresponsible.

U.S. Department of Transportation Secretary Skinner has criticized Pennsylvania's public transportation financing. His criticisms and inactions on funding is not only insulting, but has caused great friction between members of the Pennsylvania General Assembly as well as between our members of Congress.

For the information of this subcommittee, Pennsylvania ranks second in the nation in its contributions to mass transit. Over the past 11 years, Pennsylvania operating assistance for urban public transportation has nearly tripled, local government assistance has increased by 72%, **and Federal assistance has DECLINED BY 87%!** APPENDIX A of written testimony is a copy of a resolution I approved along with my fellow Commissioners of the State Transportation Commission, taking strong exception to Secretary Skinner's comments and inactions. The Commission is a bipartisan 15-member body established by statute to work with state government to establish transportation improvement programs.

I urge you to take the time to read this resolution so that you may better understand our situation.

Secretary Skinner's inaction has created a sense of panic among elected officials in areas served by our crumbling mass transit systems. In the Pennsylvania General Assembly, a bill was defeated which proposed a constitutional amendment to allow monies restricted to highway and bridge improvements to be used for mass transit. This legislation was very divisive to the Assembly because legislators unserved or underserved by mass transit saw it as an effort by Philadelphia and Pittsburgh to grab monies critical to their transportation infrastructure.

In Washington, Congressman William Gray has added a provision to the House of Representatives' transportation appropriations bill in a frustrated effort to help this problem. The amendment would require the U.S. Secretary of Transportation to withhold 25% of Pennsylvania's 1991 Federal highway monies unless we enact a dedicated mass transit revenue source. Congressman Gray has a very unhappy constituency and I'm sure, is trying to come up with the best solution possible. From a state-wide prospective however, I fear that this measure will create more problems than it solves. Pennsylvania does not react well to coercive, punitive legislation from Washington and I can assure you that the resulting dedicated fund will do little

to address this problem. I would hope that the members of this subcommittee can convince my friend to rethink this proposal. I would also hope that you will look very carefully at how the Federal government is neglecting our systems; remember all the good work that was done promoting mass transit after the last energy crisis; and consider the wisdom of Secretary Skinner's inaction as the events in the Persian Gulf unfold.

The highway funding picture has been much brighter in Pennsylvania. Thanks to the efforts of Congressman Murtha, Congressman Kolter and Congressman Shuster, Pennsylvania has received nearly $2 billion in highway and bridge funds over the last four years as well as nearly $800 million in additional discretionary funds. This money when combined with state, local and an encouraging amount of private funds, has allowed us rebuild crumbling infrastructure and has helped us provide transportation facilities vital to Pennsylvania communities hard hit by recent changes in our industrial base.

This strong federal, state, and local partnership is critical to our nation's transportation needs and must continue. As we approach the next century, the Federal government has an opportunity, working in this partnership, to prepare the country for the dramatic changes in transportation that will occur. Federal resources should

remain focused on critical transportation needs. As we enter the post-interstate era, I believe that we should begin to concentrate on maintaining the existing interstate and its supporting arteries. For example, U. S. Route 22 which traverses Westmoreland County is in a very dangerous state of disrepair. We hope to begin reconstruction next summer on portions of this highway, but without Federal support at existing or increased levels, highways such as this would simply close.

We also have many non-interstate "missing links" here in Pennsylvania that need your continued support. Route 356 for example would open up much of northern Westmoreland County to the Pittsburgh markets. Relieving congestion on our facilities must become a priority and completing these "missing links", particularly in the rural and suburban communities, is essential.

This great public partnership we have forged should also be augmented by user fees. We in Pennsylvania have begun major project that will be funded by tolls. Consideration should be given in Congress to allow us to toll existing facilities. Interstate 80 for example cost Pennsylvania nearly $60 million per year to maintain. We believe that tolling facilities such as this may in the near future be the only practical way to keep it usable and safe without neglecting the rest of our system.

We must, however do more than build more highways. We must find better ways to move people and freight. Efforts must be made to rebuild our rail systems. We cannot afford to let our rail right-of-ways disappear. I am very excited about the advances in high speed passenger rail technology and am encouraged that Washington has begun to take an interest. We have the opportunity to go from the third world passenger rail system that we now have, to a nation on the cutting edge. I am convinced that the implementation of an integrated, coordinated, high speed passenger rail system in this country, will be the first step in ending our love affair with the automobile, ~~and we~~ all know that that affair will soon have to end.

On final comment. There has been much discussion recently about the possibility of raising the Federal gas tax for the purpose of deficit reduction. Those of you that serve on this subcommittee, I'm sure, will agree that this would be very detrimental to our transportation system. As would likely have occurred had the recent effort here in Pennsylvania to use a gas tax for mass transit been successful, such a move in Washington would make the gas tax fair game for every "crisis" that came along.

Thank you for inviting me here today. I assure you that the House Transportation Committee stands ready to work with you

on the critical transportation needs of our nation.

STATE TRANSPORTATION COMMISSION

COMMONWEALTH OF PENNSYLVANIA
HARRISBURG

July 17, 1990

Honorable Samuel K. Skinner, Secretary
U.S. Department of Transportation
400 Seventh Street, S.W.
Washington, D.C. 20590

Dear Mr. Secretary:

At the regularly scheduled Quarterly Meeting on July 12, 1990 the State Transportation Commission unanimously agreed to go on record regarding Financial Assistance for Public Transportation in Pennsylvania. Accordingly, a Resolution has been prepared and approved on July 16. A copy of the Resolution is enclosed.

Sincerely,

Shirley J. Thompson

Shirley J. Thompson
Executive Secretary

cc; Members, State Transportation Commission

APPENDIX "A"

COMMONWEALTH OF PENNSYLVANIA
STATE TRANSPORTATION COMMISSION

Resolution

FINANCIAL ASSISTANCE FOR PUBLIC TRANSPORTATION IN PENNSYLVANIA

WHEREAS, public transportation in both urban and rural areas is an important component of the transportation network in Pennsylvania and throughout the nation;

WHEREAS, the National Transportation Policy states that "Transportation is a shared responsibility between the private and public sectors--the Federal Government, the State and local governments, regional agencies and authorities, quasi-public entities, and private interests;"

WHEREAS, providing financial assistance for public transportation has traditionally been a shared responsibility among federal, state and local governments;

WHEREAS, continued investment in public transportation infrastructure improvements is critically needed to prevent deterioration in system performance;

WHEREAS, the U.S. Secretary of Transportation has recently questioned the stability and reliability of Pennsylvania's state funding for public transportation;

WHEREAS, over the past 11 years, state operating assistance for urban public transportation in Pennsylvania has nearly tripled, assistance provided by local governments has increased by 72% and federal assistance has declined a staggering 87%;

WHEREAS, in FY 1990-91, Pennsylvania has committed over $440 million in state funds for urban public transportation assistance, the largest annual amount in the history of the Commonwealth;

WHEREAS, a survey conducted by the American Association of State Highway and Transportation Officials shows that in 1988-89 Pennsylvania ranked second among the states in direct financial assistance for the operation of public transportation systems, and;

WHEREAS, there is presently a cash balance of more than $6 billion in the Mass Transit Account of the Federal Highway Trust Fund, which, although dedicated to public transportation purposes, is being held to offset a portion of the federal budget deficit.

NOW, THEREFORE BE IT RESOLVED THAT THE STATE TRANSPORTATION COMMISSION, a bipartisan 15-member body established by Pennsylvania statute to work with state government to establish transportation improvement programs:

- Takes strong exception to U.S. Department of Transportation Secretary Skinner's criticism of Pennsylvania's public transportation financing mechanisms, and

- Calls on the federal government to uphold its commitment as a full partner in public transportation by releasing all available revenues and interest in the Mass Transit Account of the Federal Highway Trust Fund for their intended purposes.

Adopted this 16th day of July, 1990 by the members of State Transportation Commission, Commonwealth of Pennsylvania:

Honorable Howard Yerusalim, Chairman, Harrisburg
Honorable Robert B. Pease, Vice Chairman, Pittsburgh
Honorable J. Doyle Corman, Chairman, Senate Transportation Committee, Bellefonte
Honorable J. Barry Stout, Minority Chairman, Senate Transportation Committee, Eighty Four
Honorable Joseph A. Petrarca, Chairman, House Transportation Committee, Vandergrift
Honorable Rudolph Dininni, Minority Chairman, House Transportation Committee, Harrisburg
Honorable Roy O. Christman, Hamburg
Honorable Frank M. Henry, Wilkes-Barre
Honorable Frank D. O'Reilly, Jr., Lock Haven
Honorable Edwin W. Parkinson, Lemoyne
Honorable Harold G. Reslink, Erie
Honorable Larry O. Sather, Huntingdon
Honorable Isadore A. Shrager, Philadelphia
Honorable Gene G. Smith, Hermitage
Honorable Ernest E. Wadsworth, Johnstown

TESTIMONY OF

LAWRENCE A. ROGERS

BETHLEHEM STEEL CORPORATION
Johnstown, Pa. 15907

BEFORE THE
SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES

September 17, 1990

I am Lawrence A. Rogers, Transportation Representative for Bethlehem Steel Corporation's Bar, Rod and Wire Division, located at Johnstown, Pa. I have been employed by Bethlehem Steel, in its various transportation operations, for the past twenty-four years. Most of that time has been spent in the management of our truck shipping operations involving both outbound steel products and inbound raw materials.

Bethlehem Steel has a very large interest in our country's highway system. We are both a major supplier to, and an extremely large user of, that system. We supply large quantities of steel for bridges and guard rails. In 1989, we produced about 240,000 tons for highway and related construction. As a user, we shipped more than 400,000 truckloads from our plants over the highway system last year. We could neither assemble our raw materials nor distribute our steel products without the highways. Their efficiency and safety directly affect our operations.

It is no secret that our country has severe infrastructure problems. For years we have been living off prior investments and failing to adequately maintain and upgrade existing highways and bridges. As a result, large parts of our highway system are in disrepair---or resemble parking lots at peak hours.

If we spend too little on maintenance of these vital arteries, society loses more than the direct public cost. In the long run, our ability to compete in the international economy will be weakened and our standard of living will suffer.

To assure our continuing competitiveness, we need a renewed federal commitment to upgrade and repair our highway system---a multi-year comprehensive program to meet the demands of anticipated usage. Further, and just as important, building more roads and bridges will not solve our peak traffic problems. We owe it to ourselves to develop effective incentive systems promptly to relieve highway congestion at peak hours.

It is probably safe to assume that future federal funding for highways and bridges will come from dedicated user fees paid solely by Americans for the specific purpose of improving America's transportation system. In taxing Americans to improve America, both economics and fairness justify allowing some preference to American businesses bidding on these projects.

The Congressional Research Service (CRS) estimates that for an increase of $1 billion spent in the United States by the Federal Government on new highways and roads, total output in the economy increases by $2.4 billion annually. A $1 billion expenditure creates 50,000 additional jobs. With such powerful multipliers favoring domestic sourcing, providing some preference more than pays for itself in the generation of additional tax revenues.

Value added (VAT) and similar taxes provide many foreign producers of goods a price advantage in the U.S. market that domestic producers cannot match abroad. Significant VATs are rebated on fabricated metal products destined for the U.S. The U.S. neither applies comparable taxes on these goods upon entry nor does it provide comparable rebates on U.S. exports. Until the U.S. adopts some type of VAT or business transfer tax, it is appropriate to recognize this inequity through a "Buy American" preference. To do otherwise unfairly penalizes tax-paying American businesses.

In the perfect world there would be one truly open world market with all goods and services trading freely and fairly. Under such conditions "Buy American" provisions would neither be appropriate nor required. Today's world is quite different. Foreign countries effectively limit access to their markets, especially for government purchases, while trading unfairly in the United States. United States firms have virtually no participation in construction projects in Japan while Japanese companies do $3 billion of such business in the United States each year. In light of these realities, sound public policy requires "Buy American" provisions in the next Federal Highway Program.

In addition to the problems of design, construction, financing and maintenance of our highway system, a great deal can be done to improve the productivity, efficiency and safety of the commercial use of the system. We need to eliminate unnecessary, outdated and inefficient regulation. We need to establish uniformity and reciprocity between the states on regulation, registration and taxation and we need to establish strict truck safety rules and provide the means for the Department of Transportation to enforce those rules.

We think these issues should be dealt with in the authorization of a new, Federal Highway Program. Specifically, the reduced regulation of motor carrier entry and rates which has contributed hundreds of billions of dollars in savings on interstate trucking since its adoption in 1980 should be extended to the intrastate operations of those same carriers. Our distribution system needs to be at least as efficient in its design as that in Europe come 1992. Unfortunately, many states continue to impose barriers to competition within the trucking industry resulting in inefficiencies which an internationally competitive country cannot afford.

Nationally, the cost of continued state regulation of intrastate truck entry and rates to the consuming public is enormous. Professor W. Bruce Allen of the University of Pennsylvania's Wharton School estimates the cost at between

$5 and $12 billion dollars per year. Bethlehem Steel recently tried to inject some additional competition within Pennsylvania by sponsoring a trucker's application for authority to haul steel from our Johnstown, Bethlehem and Steelton plants to destinations within Pennsylvania. Our studies showed that rates within Pennsylvania were higher for the same mileage than they were if the destination was out of state. The trucker had been carrying thousands of tons of steel from these same plants to destinations outside the state for several years. Therefore, there was no question of his fitness, but it still took sixteen months and $25,000 in legal expenses to get even a highly restricted operating authority. The permit which was granted forces inefficiencies since it gives the trucker authority to haul only to or from Bethlehem Steel facilities and it cannot avail itself of opportunities to reduce its empty miles with other traffic. The whole exercise is an example of what is wrong with regulation. The process denies the consumer the benefits of competition and forces motor carriers to operate unnecessary empty miles.

The diversity of state tax regulations also imposes large, unnecessary administrative costs on any motor carrier operating in multiple states. More uniformity and reciprocity are needed to reduce such unproductive paperwork. Advances can be attained without undue interference with the freedom of states to decide on levels and forms of taxation. Federal

guidelines and incentives, however, are necessary if they are to be accomplished.

Since no unsafe system can be truly efficient, measures should be taken to force motor carriers to operate safely. Inspection programs should be improved with the addition of measures to see that defects are corrected. The market should be brought to bear by giving the Department of Transportation enhanced ability to shut unsafe operations down.

H.R. 4261, the Safe and Competitive Trucking Act of 1990, is directed at these improvements in the commercial use of the nation's highway system. We urge the inclusion of the provisions of H.R. 4261 in the Highway Reauthorization legislation in 1991. Bethlehem Steel and the country's industries in general need the efficiencies these provisions would bring to our distribution system if we are to be world competitive in the 1990's.

First, we have to have a good highway system and second, we have to use it efficiently.

STATEMENT BY

VICKIE SHAFFER, GENERAL MANAGER
TRI-STATE TRANSIT AUTHORITY
HUNTINGTON, WEST VIRGINIA

ON BEHALF OF

COMMUNITY TRANSPORTATION ASSOCIATION OF AMERICA

BEFORE THE

SURFACE TRANSPORTATION SUBCOMMITTEE
HOUSE PUBLIC WORKS COMMITTEE

EBENSBURG, PENNSYLVANIA
SEPTEMBER 17, 1990

CTAA STATEMENT OF TRANSIT REAUTHORIZATION

Mr. Chairman, Members of the Committee, my name is Vickie Shaffer. I have been the General Manager of The Tri-State Transit Authority since 1980. Our transit system serves the greater Huntington, West Virginia urbanized area. I am appearing on behalf of the Community Transportation Association of America (CTAA), a national organization of rural, small urban and specialized transportation providers. Our association advocates on behalf of the particular needs and problems of the nation's small and medium-sized transportation providers. That is the perspective from which I will testify. I might add that I am also an active member of the Small Operations Steering Committee of the American Public Transit Association (APTA).

My own system operates a fleet of 26 vehicles, employs 51 persons and serves an area population of approximately 86,000 people. We provide 725,000 bus trips a year, largely on regular route service. Like other small urban and rural operators, our ridership is largely accounted for by women, senior citizens, folks with low incomes and others who are almost entirely dependent on our bus service for their transportation - more so than the average American citizen.

The process of reauthorizing our federal transit legislation and programs give us the opportunity to reassess our existing policies and to respond to change. In that process, I hope that we are successful in recognizing the changes that have occurred in our transportation needs since the last reauthorization. And, as critical, I hope that we can meet the challenge that faces us to reduce our dependence on foreign oil by making a credible investment in the mass transit alternative to the private automobile.

Small Urbanized Areas

The Huntington urbanized area is one of 251 such areas with populations of less than 200,000 people. It is worth noting that 30% of those areas remain unserved by federally-assisted public transit. It is expected that when the returns are all in from this year's census, the number of small urbanized areas - those under 200,000 population - will increase by 45 or 50 in number. Furthermore, at least one-half of those newly designated areas will also be without any federal transit assistance.

Those of us who do have transit services have, in recent years, been increasingly squeezed between what we in West Virginia call "a rock and a hard place." The cost and demand for service have risen while the federal support for mass transit has declined. While small urbanized areas collectively account for 11 to 12 percent of the nations population, we only receive about 5 or 6 percent of federal transit assistance; just over 8% of forumula assistance but only a miniscule amount of discretionary capital assistance.

Our research indicates that the percentages of formula funds that now go the small urban and rural areas of America reflect no more than a codification of where money was going when the Urban Mass Transportation Administration (UMTA) was originally authorized. These formula do not, and never have, reflected a distribution of funding based upon need, national priorities or political reality.

Rural Mobility Needs

Before the last 10 or 15 years, there was little recognition that rural areas might have transit needs. Now there is a growing awareness that they account for at least one-third of all the people who can be considered transit dependent because of their lack of access to adequate private transportation resources such as a family car or pick-up truck. Enactment in 1978 of the Section 18 Rural Rransit Program made possible the clear demonstration that mobility needs are not only real but extensive in rural America. Provision of public transit outside urbanized areas has grown substantially in the last ten years - from an estimated 800 providers in 1980 to nearly 1,200 today.

Despite the dramatic growth, nearly one-half of the nation's rural residents still live in counties without any public transit service. In many of those counties where there is service, it is limited to only portions of the county and frequently to only a few days of the week. CTAA has estimated that current transit service in rural areas is adequate to serve only about one-tenth of the basic transportation needs of an isolated and transit-dependent population.

Increased Transit Accessibility

Enactment this year of the Americans with Disabilities Act (ADA) constitutes both a recognition and a challenge. The ADA recognizes the basic importance of mobility to the quality of life for all and specifically for persons with disabilities. It is a challenge to make that mobility a reality by extending access to public transit to those previously unserved. Meeting that challenge will require a real commitment from those of us who are transit providers. And, alas, it also commands a commitment on the part of federal policy makers to provide the funding to make their essential pledge in the ADA a reality.

Coordinating Federal Transit Investment

There is a growing awareness at the state and federal level that the Urban Mass Transportation Administration is not the only federal agency providing significant levels of support for transit. To the $3 billion a year currently invested in transit by UMTA, one must add another $1 billion which represents spending by social service programs on the transportation that is essential to their assistance roles. Both from the standpoint of cost-effectiveness and from that of optimum service delivery, there is a genuine need for better coordination by public transit and human service providers of both demands and resources. Federal transit policy simply cannot afford to ignore one-fourth of the picture.

CTAA's REAUTHORIZATION RECOMMENDATIONS

In order to respond to the needs that I have summarized here, CTAA believes that we must restore federal transit investment and support to a more appropriate place on the roster of national priorities and that we must restructure the ways in which that assistance is carried out to better serve the transportation needs defined by our smaller communities and the transit dependent public.

I don't really need to spend much time on the first point. We are all painfully aware of the degree to which relative federal support for transit has eroded in the last decade. The results are manifest in our aging vehicle fleets, rising costs and declining services. They are also, we believe, a major factor in our nation's declining economic competitiveness and worsening environmental circumstances.

Federal transit investment has dropped to less than one-half of what it was ten years ago - figured in constant dollars. In terms of its relative importance in the federal budget, it is only about one-fourth the level of a decade earlier. In short, we would need to double, I repeat, double the level of support for transit just to get back to where we were in 1980.

At the very least, we should start by spending down the current surplus in the Mass Transit Account. CTAA has joined APTA and other transit advocates in endorsing an increase in the gasoline tax earmarked for expanded transit assistance.

In terms of the restructuring needed in the federal transit programs, CTAA and its members urge that reauthorization include:

1) Allocation of at least 10 percent of total UMTA assistance to small urbanized areas - both to repair the damage from the underfunding of recent years and to meet the expanding needs of new and previously unserved small urban areas.

2) Allocation of at least 5 percent of total UMTA assistance to rural areas. The mobility needs of rural Americans have been seriously neglected over the years and have contributed to economic stagnation and a growing isolation from our national transportation network. In my own state of West Virginia, for example, less than one-half of the rural counties are served by a public transit system. It is a situation, as I indicated earlier, that is not unique to my state. Our recommended level of 5 percent would still be far below rural America's share of both total and transit dependent population.

A combined allocation of 15 percent of total formula funds to small urban and rural America would come much closer to reflecting a distribution of funding based upon need, national priorities and political reality than today's formulas which reflect no more than a codification of the way things used to be.

3) Establishment of a Mobility Assistance Fund within the Mass Transit Account of the Highway Trust Fund to assure adequate resources to meet our commitment to mobility for the disabled and others who are highly dependent on access to transit service. This fund should be assigned a minimum percentage share of total Mass Transit Account support; its assistance should be distributed to all areas on a formula basis; and it should be earmarked for the following purposes:

a) Continuation of current capital assistance and elderly and handicapped transportation through the Section 16 (b)(2) program;

b) Meeting part of the incremental costs of making all fixed-route vehicles fully accessible as required by the Americans with Disabilities Act.

c) Meeting part of the incremental costs of continuing and expanding supplemental paratransit services as required by ADA; and

d) Implementing and underwriting at the state and local level, formal coordination mechanisms involving both public and human service transportation providers to develop and carry into effect appropriately coordinated transportation arrangements.

We believe that a reauthorization of transit programs that includes these elements will give federal transit investment the higher priority that world events today demand and that the Country deserves. We also believe that these elements will, in turn, give greater priority within the federal transit program to the needs of those who are entirely dependent upon it - needs which should be at the core of any national transit policy.

On behalf of CTAA and myself, thank you for the opportunity to express our views. I will be glad to try and respond to any questions you may have.

REAUTHORIZATION OF THE FEDERAL SURFACE TRANSPORTATION ASSISTANCE ACT

Presented By
Paul P. Skoutelas
Deputy Executive Director
Port Authority of Allegheny County

Before The

SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
U.S. HOUSE OF REPRESENTATIVES

Ebensberg, Pennsylvania
September 17, 1990

I WANT TO THANK AND COMMEND THE HOUSE SURFACE TRANSPORTATION SUBCOMMITTEE FOR HOLDING ITS HEARING TODAY IN WESTERN PENNSYLVANIA, AND FOR ITS EFFORTS TO FOCUS CONGRESSIONAL ATTENTION ON THE SURFACE TRANSPORTATION NEEDS FACING THIS COUNTRY. WHILE THE CONGRESS HAS BEEN UNDERSTANDABLY PREOCCUPIED WITH INTERNATIONALLY SIGNIFICANT EVENTS SUCH AS THE CRISIS IN THE MIDDLE EAST, AND DOMESTIC ISSUES SUCH AS THE COLLAPSE OF U.S. SAVINGS AND LOANS, AND THE NEED FOR BETTER ENVIRONMENTAL LAWS, THE NEED TO REHABILITATE AND IMPROVE OUR NATION'S TRANSPORTATION NETWORK HAS BEEN PATIENTLY WAITING ITS TURN AS AN ISSUE OF CRITICAL NATIONAL IMPORTANCE. INDEED, FEW ISSUES ARE AS CRITICAL TO THE NATION'S ECONOMIC AND SOCIAL WELL BEING, OR AS CENTRAL TO OUR DAILY LIVES AND LIFESTYLE AS IS OUR PERSONAL MOBILITY. IT IS TIME FOR CONGRESS TO ONCE AGAIN PUT FORTH STRONG POLICIES IN SUPPORT OF EFFECTIVE TRANSPORTATION INVESTMENTS.

I AM PAUL P. SKOUTELAS, DEPUTY EXECUTIVE DIRECTOR OF PORT AUTHORITY OF ALLEGHENY COUNTY, A LARGE TRANSIT SYSTEM BASED IN PITTSBURGH, PA. I AM HERE REPRESENTING WILLIAM W. MILLAR, PORT AUTHORITY EXECUTIVE DIRECTOR. MR. MILLAR IS ALSO THE LEGISLATIVE CHAIRMAN FOR THE PENNSYLVANIA ASSOCIATION OF MUNICIPAL TRANSPORTATION AUTHORITIES (PAMTA) WHICH REPRESENTS 33 SMALL AND LARGE PUBLIC TRANSIT AGENCIES ACROSS THE COMMONWEALTH OF PENNSYLVANIA. PORT AUTHORITY - WHICH LOCAL RESIDENTS KNOW SIMPLY AS "PAT" - OWNS AND OPERATES OVER 900 BUSES, 71 STREETCARS AND LIGHT RAIL VEHICLES AND TWO INCLINED PLANES. IN ADDITION, PAT CONTRACTS WITH 13 PRIVATE TAXI COMPANIES AND HUMAN SERVICE AGENCIES TO PROVIDE SPECIALIZED TRANSIT SERVICE FOR ELDERLY AND DISABLED PERSONS THROUGH A POPULAR AND SUCCESSFUL PROGRAM KNOWN AS

"ACCESS". ON A TYPICAL WEEKDAY ABOUT 300,000 TRANSIT RIDERS USE PAT SERVICES TO TRAVEL TO AND FROM THEIR JOBS, TO SHOP, TO WORSHIP, TO GO TO SCHOOL OR TO PURSUE OTHER SOCIAL AND PROFESSIONAL NEEDS. IN SHORT, WE OFFER MOBILITY TO THOUSANDS OF INDIVIDUALS WHO CHOOSE TO UTILIZE PUBLIC TRANSIT FOR ITS CONVENIENCE AND COST SAVINGS OR WHO HAVE NO ALTERNATIVE MEANS OF TRANSPORTATION.

OVER THE PAST TWENTY-FIVE YEARS A FEDERAL-STATE-LOCAL PARTNERSHIP HAS SUCCESSFULLY BROUGHT ABOUT A REVITALIZATION OF PUBLIC TRANSIT IN ALLEGHENY COUNTY. PORT AUTHORITY'S SERVICES PROVIDE FOR THE DAILY TRANSPORT OF SIXTY PERCENT OF DOWNTOWN PITTSBURGH'S COMMUTERS AND FIFTY PERCENT OF DAILY DOWNTOWN SHOPPERS. A NEW DOWNTOWN SUBWAY IS CARRYING PASSENGER VOLUMES ABOVE THOSE WHICH WERE PROJECTED AND PORT AUTHORITY'S HIGHLY SUCCESSFUL SOUTH AND MARTIN LUTHER KING, JR. EAST BUSWAYS HAVE BECOME MODELS FOR TRANSIT SYSTEMS THROUGHOUT THE WORLD. THE CAPITAL AND OPERATING SUPPORT PROVIDED THROUGH THE FEDERAL TRANSIT PROGRAM HAS CLEARLY BEEN A CATALYST TO THIS SUCCESS STORY.

OVER THE PAST SEVERAL YEARS, HOWEVER, GENERAL FUND APPROPRIATIONS TO THE FEDERAL PUBLIC TRANSPORTATION PROGRAM HAVE BEEN SIGNIFICANTLY BELOW THE AMOUNTS AUTHORIZED. THIS HAS BROUGHT ABOUT A BACKLOG OF REINVESTMENT NEEDS, AND A SHORTAGE OF CAPITAL TO TAKE ADVANTAGE OF NEW OPPORTUNITIES. PORT AUTHORITY'S CAPITAL NEEDS OVER THE NEXT 10 YEARS WILL BE IN EXCESS OF $2 BILLION. THESE FUNDS WILL BE NEEDED TO FINANCE ROUTINE REPLACEMENT OF PAT'S FACILITIES AND ROLLING STOCK AS WELL AS TO MAKE NEW INVESTMENTS TO EXPAND THE PUBLIC TRANSPORTATION

SYSTEM. AMONG THESE PROJECTS IS PORT AUTHORITY'S AIRPORT BUSWAY, WHICH WILL PROVIDE A CRITICAL LINK BETWEEN DOWNTOWN PITTSBURGH AND THE NEW MIDFIELD TERMINAL OF THE GREATER PITTSBURGH INTERNATIONAL AIRPORT CURRENTLY UNDER CONSTRUCTION AND DUE TO OPEN IN THE FALL OF 1992.

IT HAS BEEN SAID THAT OUR PUBLIC INFRASTRUCTURE IS THE GLUE WHICH HOLDS OUR PRIVATE ECONOMY TOGETHER. DAVID ASCHAUER, AN ECONOMIST AT THE FEDERAL RESERVE BANK OF CHICAGO, WROTE IN THE WALL STREET JOURNAL RECENTLY: "PRIVATE SECTOR PRODUCTION OF GOODS AND SERVICES DEPENDS CRUCIALLY UPON AN ADEQUATE AND WELL-MAINTAINED STOCK OF PUBLIC SECTOR CAPITAL: A PUBLIC INFRASTRUCTURE OF ROADS, BRIDGES, MASS TRANSIT, WATER AND SEWER SYSTEMS AND SIMILAR FACILITIES. IF PUBLIC SECTOR CAPITAL ACCUMULATION FAILS TO KEEP PACE WITH PRIVATE SECTOR CAPITAL ACCUMULATION, IT CAN BE EXPECTED THAT:

1) THE RATE OF RETURN TO PRIVATE CAPITAL WILL SUFFER;
2) PRIVATE INVESTMENT WILL BE DEPRESSED; AND
3) PRIVATE SECTOR PRODUCTIVITY WILL STAGNATE."

WHILE WE MAY WELL AGREE ON THE IMPORTANCE OF AND THE NEED FOR TRANSPORTATION INVESTMENTS, THE QUESTION OF HOW TO PAY FOR THESE INVESTMENTS HAS BEEN A MATTER OF CONSIDERABLE DISCUSSION. EARLIER THIS YEAR PRESIDENT BUSH AND U.S. TRANSPORTATION SECRETARY SAMUEL SKINNER PRESENTED AN OUTLINE FOR A NATIONAL TRANSPORTATION POLICY. THEIR REPORT PUT FORTH A NUMBER OF EXCELLENT CONCEPTS, SUCH AS THE NEED FOR INCREASED INVESTMENT IN TRANSIT INFRASTRUCTURE, FLEXIBILITY IN USE OF CERTAIN HIGHWAY AND TRANSIT FUNDING AND THE NEED TO INTEGRATE

REGIONAL LAND USE POLICIES WITH REGIONAL INVESTMENT DECISIONS. THE PLAN HIGHLIGHTED THE ECONOMIC IMPORTANCE OF IMPROVED TRANSPORTATION SYSTEMS, BUT LEFT OPEN THE ISSUE OF WHO WOULD ASSUME THE LEAD IN RESPONDING TO SUCH NEEDS. RECENTLY HOWEVER, WITH WORLD ATTENTION RIVETED ON THE MIDDLE EAST AND POSSIBLE WORLDWIDE PETROLEUM SHORTAGES, SECRETARY SKINNER ELABORATED ON HIS THOUGHTS, SAYING IN AN INTERVIEW:

> "AS PART OF OUR DESIRE IN THE AREA OF ENERGY CONSERVATION OBJECTIVES, IT MAY VERY WELL BE THAT NEXT YEAR'S MASS TRANSIT BUDGET AND THE OUT-YEAR BUDGETS MAY GET A BIGGER SHARE OF FEDERAL FUNDING AS WELL AS AN ENCOURAGEMENT FOR GREATER LOCAL FUNDING."

TO ACCOMPLISH OUR GOALS, IT WILL INDEED BE NECESSARY FOR ALL LEVELS OF GOVERNMENT TO ACT. PORT AUTHORITY OF ALLEGHENY COUNTY AS WELL AS OTHER MEMBERS OF PAMTA ARE WORKING HARD TO OBTAIN INCREASED FUNDING FOR PUBLIC TRANSPORTATION AT THE STATE AND LOCAL LEVEL. LIKEWISE, FEDERAL FUNDING MUST ALSO BE INCREASED TO SUPPORT ADDITIONAL INVESTMENT IN VITAL TRANSIT FACILITIES AND SERVICES.

PUBLIC TRANSPORTATION MUST BE VIEWED AS AN INVESTMENT AND NOT AS AN EXPENDITURE. IT MUST BE VIEWED AS AN INVESTMENT IN CLEAN AIR AND A LIVABLE ENVIRONMENT; AN INVESTMENT IN ENERGY CONSERVATION AND IN NATIONAL SECURITY AS WE FIND WAYS TO REDUCE OUR DEPENDENCE ON FOREIGN OIL; A CRITICAL NATIONAL NEED AS IS SO PLAINLY EVIDENT BY WHAT IS CURRENTLY TRANSPIRING IN THE MIDDLE EAST. PUBLIC TRANSIT MUST ALSO BE

VIEWED AS AN INVESTMENT IN THE EFFICIENT USE OF OUR HIGHWAY SYSTEMS AND THE TAX DOLLARS WHICH SUPPORT THAT SYSTEM; AS AN INVESTMENT IN SAFETY AND ECONOMIC GROWTH; AS AN INVESTMENT IN A BETTER QUALITY OF LIFE. IN SHORT, PUBLIC TRANSIT IS AN INVESTMENT IN PEOPLE AND IT IS AN INVESTMENT THAT MUST BE EXPANDED.

AN INCREASE IN THE FEDERAL GAS TAX IS A LOGICAL SOURCE FOR THIS INVESTMENT. I URGE THE COMMITTEE TO BUILD THE NEXT SURFACE TRANSPORTATION REAUTHORIZATION BILL AROUND AN INCREASE IN THE FEDERAL GAS TAX. TOGETHER WITH CURRENT FEDERAL FUNDING FOR PUBLIC TRANSPORTATION A SEVEN CENT HIKE IN THE FEDERAL GAS TAX WOULD SUPPORT A FEDERAL TRANSIT PROGRAM OF $11 BILLION PER YEAR TO RESTORE AND EXPAND BUS, RAIL AND OTHER SHARED-RIDE SERVICES. I BELIEVE THAT A BOLD, AMBITIOUS PROGRAM OF THIS MAGNITUDE IS ABSOLUTELY NECESSARY IF PUBLIC TRANSPORTATION IS TO HAVE THE DESIRED, PROMINENT IMPACT ON OUR TRANSPORTATION FUTURE.

I FURTHER URGE CONGRESS TO DISBURSE FOR TRANSPORTATION PURPOSES ALL MONIES IT COLLECTS AND HAS COLLECTED THROUGH THE FEDERAL GAS TAX, AND TO ALLOW THESE USER FEES TO BE USED ONLY FOR TRANSPORTATION PURPOSES. PENDING PROPOSALS WHICH WOULD INCREASE THE GAS TAX FOR NON-TRANSPORTATION PURPOSES RUN COUNTER TO THIS USER FEE RELATIONSHIP WHICH HAS WORKED WELL FOR MANY YEARS AND WHICH IS SO INTEGRAL TO FUTURE TRANSPORTATION INVESTMENTS.

BEYOND THIS I BELIEVE THERE IS AN EVOLVING CONSENSUS AMONG PUBLIC INTEREST GROUPS AS TO THE STRUCTURE OF THE NEW PROGRAM. THE TWO ESSENTIAL ELEMENTS OF THE PROGRAM SHOULD BE:

1. REINVESTMENT IN EXISTING TRANSIT SERVICES

ADEQUATE FEDERAL FUNDING FOR THE RENEWAL OF EXISTING TRANSIT SERVICES SHOULD BE PROVIDED BY FORMULA DIRECTLY TO TRANSIT AGENCIES TO BE USED IN ACCORDANCE WITH LOCALLY DETERMINED TRANSIT NEEDS. A MINIMUM ANNUAL FEDERAL INVESTMENT OF $6.5 BILLION WILL BE NEEDED TO ADDRESS THESE FUNDAMENTAL REINVESTMENT REQUIREMENTS. THIS ELEMENT OF THE PROGRAM SHOULD PROVIDE INCREASED LEVELS OF OPERATING ASSISTANCE TO ALL SIZES OF OPERATORS.

2. METROPOLITAN "CAPACITY EXPANSION" PROGRAM

SUPPLEMENTING THIS REINVESTMENT PROGRAM, FUNDING SHOULD BE PROVIDED AT THE METROPOLITAN LEVEL FOR THE FUNDING OF MAJOR CAPACITY EXPANSION. THE METROPOLITAN REGION WOULD DETERMINE THE TRANSIT AND/OR HIGHWAY USE FOR THESE FUNDS, CONSISTENT WITH LOCAL OBJECTIVES. CURRENTLY, INVESTMENT DECISIONS ARE OFTEN BIASED TOWARD A PARTICULAR MODE DUE TO FACTORS SUCH AS THE AVAILABILITY OF TARGETED CATEGORICAL FUNDING, OR BY DIFFERENCES IN LOCAL MATCH REQUIREMENTS FROM ONE MODE TO ANOTHER.

THE AMERICAN PUBLIC TRANSIT ASSOCIATION'S TRANSIT 2000 TASK FORCE REPORT TITLED "MANAGING MOBILITY" PROVIDES AN EXCELLENT DISCUSSION OF THESE AND OTHER CONCEPTS. I URGE THE COMMITTEE TO CONSIDER THESE IDEAS AS IT DEVELOPS AND ENACTS REAUTHORIZING LEGISLATION.

THERE IS ALSO A STRONG CONSENSUS IN SUPPORT OF A SIGNIFICANTLY INCREASED TRANSIT RESEARCH AND DEVELOPMENT PROGRAM. EXPANDED FEDERAL SUPPORT FOR BASIC TECHNOLOGICAL AND OPERATIONS RESEARCH ON BEHALF OF PUBLIC TRANSPORTATION WILL ENABLE TRANSIT OPERATORS TO PERFORM BETTER, AND WILL ENSURE THE SURVIVAL OF A VIGOROUS DOMESTIC SUPPLY INDUSTRY AND THE JOBS AND REVENUES THAT INDUSTRY CREATES. WE HAVE SEEN THE EFFECTS OF TOO LITTLE RESEARCH IN OTHER FIELDS. INNOVATION IS STIFLED AND NEW CHALLENGES CANNOT BE MET. DOMESTIC SUPPLIERS WITHER AND JOBS ARE LOST OFFSHORE. TRANSIT NEEDS TO BE INNOVATIVE IF IT IS TO IMPROVE ITS EFFICIENCY, RUN CLEANER BUSES, AND MEET THE GROWING DEMAND FOR ITS SERVICES INTO THE NEXT CENTURY. RESEARCH CAN PROVIDE THE GUIDING LIGHT.

A REPORT BY THE TRANSPORTATION RESEARCH BOARD TITLED "RESEARCH FOR PUBLIC TRANSIT: NEW DIRECTIONS" (TRB SPECIAL REPORT 213) OUTLINES THE SCOPE AND CONTENT OF SUCH A PROGRAM. THE RECOMMENDATIONS OF THIS REPORT SHOULD BE USED AS A BLUEPRINT TO DEVELOP A NEW FEDERAL INITIATIVE ON TRANSIT RESEARCH AND DEVELOPMENT.

IN CONCLUSION, THE REAUTHORIZATION OF THE FEDERAL SURFACE TRANSPORTATION PROGRAM PROVIDES THE OPPORTUNITY TO LOOK TO NEW POLICIES AND PROGRAMS TO DIRECT THE COURSE OF OUR NATION AND ITS COMMUNITIES. IF WE DO NOTHING TO CHANGE CURRENT TRENDS OUR CITIES AND SUBURBS WILL FACE A FUTURE OF GRIDLOCK; PUBLIC MOBILITY WILL BE CONTINUALLY THREATENED BY FOREIGN OIL AND INTERNATIONAL INSTABILITY;

OUR ABILITY TO COMPETE IN GLOBAL MARKETS WILL CONTINUE TO DECAY, THE AIR WE BREATHE AND THE WORLD ENVIRONMENT WILL DETERIORATE.

FEDERAL POLICIES NEED TO COUNTER SUCH TRENDS, NOT CONTRIBUTE TOWARD THEM. A POLL CONDUCTED IN JUNE BY MARKET STRATEGIES, INC. REVEALED THAT EXTENSIVE PUBLIC SUPPORT EXISTS FOR ADDITIONAL INVESTMENTS IN PUBLIC TRANSPORTATION. SIXTY-SIX PERCENT OF THOSE POLLED SAID THEY WOULD BE WILLING TO PAY SEVEN CENTS PER GALLON MORE IN FEDERAL GASOLINE TAXES IN ORDER TO EXPAND PUBLIC TRANSPORTATION AND MAINTAIN HIGHWAYS IN THE AREAS WHERE THEY LIVE. ESTIMATES ARE THAT THIS WOULD COST THE AVERAGE DRIVER ABOUT $1 PER WEEK OVER THE COURSE OF A YEAR. MOREOVER, FORTY-EIGHT (48) PERCENT OF AMERICANS AGREE WITH THE IDEA THAT "WE MUST BEGIN NOW TO PROVIDE MORE TRANSPORTATION CHOICES, AND REDUCE DEPENDENCE ON DRIVING ALONE IN PERSONAL CARS".

THUS, THE REINACTMENT OF THE FEDERAL SURFACE TRANSPORTATION ASSISTANCE ACT OFFERS THE OPPORTUNITY TO INFLUENCE TRANSPORTATION DECISIONS AND CHOICES IN WAYS WHICH WILL POSITIVELY IMPACT OUR LIFESTYLE AND QUALITY OF LIFE FOR MANY YEARS AHEAD. I PLEDGE TO WORK WITH YOU IN THIS TASK IN ANY WAY I CAN. THANK YOU FOR THE OPPORTUNITY TO TESTIFY.

38-253 O—91——98

TESTIMONY OF STATE SENATOR WILLIAM
J. STEWART ON BEHALF OF THE CAMBRIA
CO. LEGISLATIVE DELEGATION

U.S. HOUSE COMMITTEE ON PUBLIC WORKS
AND TRANSPORTATION

SUB-COMMITTEE ON SURFACE TRANSPORTATION

SEPTEMBER 17, 1990

Thank you for the opportunity to comment on critical transportation infrastructure needs of our region as you prepare to map out a strategy for the nation's highway future.

Just as State Legislatures will have to make difficult decisions in re-drawing Legislative District maps next year, Congress will have to make difficult decisions in re-drawing the Transportation needs map.

I must say that we in the Pennsylvania Legislature have been used to making difficult decisions regarding our infrastructure as Federal dollars have been steadily decreasing.

When Federal sewer and water monies went by the wayside, we responded with a 500 million dollar State Bond program named PennVest.

We took the lead in funding a billion dollar program to repair and replace our deteriorating and unsafe bridges.

Our State and local economic development programs and expenditures have been rated as some of the best in the nation.

And in the highway area we even developed a strategy to construct and reconstruct some of our major roads as part of the Pennsylvania Turnpike system as toll roads. This is an onerous alternative to the historic "freeway" concept, but one that we felt was the only realistic way to accomplish what we all agree needs to be done. U.S. Route 219 is part of that package, and I want to emphasize the U.S. designation.

Alice Rivlin, former Director of the Congressional Budget Office and now with the Brookings Institute has said, "If the United States is to have a world class economy for the 21st Century, State governments will have to take the lead."

I submit to the Committee that Pennsylvania has demonstrated a clear willingness to do just that, but I must appeal to you to reverse the "fend for yourself Federalism" particularly in the area of highway and mass transit funding.

One major highway need that desparately needs Federal assistance is U.S. Route 22, specifically from Mundy's Corner to Pittsburgh. Everyone in the economic development community has identified this connection to Pittsburgh as being critical to our future growth. Everyone in the Pennsylvania Dept. of Transportation recognizes this, as evidenced by the recent 1 million dollar committment of State money to begin engineering and design. And most assuredly, every member of the families of the 1530 people that have been killed or injured in a five year period on this Route understand the critical need for improvement. But without Federal construction dollars this goal will probably never be achieved.

I congratulate you on what has already been done on Rt.22 from Altoona to Mundy's Corner, but we need to continue westward.

I want to implore you that when you make those difficult decisions that I mentioned earlier, whether they be prying the Highway Trust Fund money loose from the Budget balance sheet or raising the gasoline tax, that you consider prioritizing projects in those areas and in those States like Pennsylvania who have made difficult fiscal decisions already on their own.

I feel certain that I speak for my colleagues in saying that we stand ready to assist you in this most important work.

Our economic future is highly dependent upon what this Committee does or does not do.

Thank you again for the chance to express what we feel is the majority opinion of our mutual constituents.

PACT STATEMENT OF TRANSIT REAUTHORIZATION

Mr. Chairman, Honorable Members of the Committee, Staff and Guests:

My name is Vaughn E. Whisker, and I am Paratransit Administrator for the County of Erie, Pennsylvania. I am also President of the Pennsylvania Association of Community Transportation, PACT, and State Delegate for the Community Transportation Association of America, CTAA.

The County of Erie paratransit system about delivers 190,000 trips per year, to the elderly, disabled and those unable to use fixed route transit systems. The cost of operations is paid by the State Lottery subsidy of trips for the elderly, Medical Assistance Transportation Program service, and Section 504 services under contract to our Transit Authority for disabled persons unable to use their route service and contracts to various human service programs. Actual transportation service is delivered by a taxi cab company using a combination of Section 16 (b)(2) acquired vehicles and their own cabs.

PACT represents 75 private for profit and non profit transportation systems, authorities and governmental member agencies which during the year ending July 1990, delivered about 15 million one way trips to the elderly, disabled and members of the general population.

CTAA is a national association of 453 members representing small urban and rural transit and human service transportation providers in every state in the union. Pennsylvania, with 39 members, has the largest delegation of any state. CTAA's comments are reflected in the written testimony provided by Ms. Vicki Shaffer, the General Manager of Tri-State Transit Authority in Huntington, West Virginia, another State Delegate to CTAA.

My comments support the testimony of Mr. Harold Jenkins, General Manager of Cambria County Transit Authority, and written comments of Ms. Shaffer, on the vital services provided by the Department of Transportation and the grants they administer. Transit is the only answer to solve the grid lock facing workers and shoppers going into our metropolitan centers. It is important to our workers and families with a single car in our small urban centers. It is vital in our rural areas where there is no other options open to elderly or disabled who are unable to drive or to the rural poor.

I aim my remarks at a comparatively small element of the Department and of the Mass Transit Act of 1964, as amended. That element is Section 16(b)(2) and ask that element of the law be combined with Section 16(b)(1) to allow government entities access to the vehicles awarded under the grant and to allow government entities to apply directly for the Section 16(b)(2) grant. These governmental agencies, in many areas of the country, have combined and taken over the role which was formerly met by individual private non profit organizations.

Since the implementation of Section 16(b)(2) in the mid 1970's and the emphasis on coordinated transportation, the single human service agency has been largely superseded by the single transit agencies which are governmental in nature or authorities. These larger organizations were governmental entities because no other organization, for or non profit, was interested or able to provide the required service. That service is to provide transportation

services to the elderly, mentally and physically disabled, low income and disadvantaged citizens. Most have responded to the needs of the diabled for years prior to the introduction of the Americans with Disabilities Act.

However, if they are a government entity as most of PACT an CTAA's membership are, they are not eligible to receive vehicles from Section 16(b)(2). The funding streams which formerly were used to purchase vehicles, have dried up and the situation has become critical. In a survey conducted this summer of PACT members, half the vehicles were by UMTA standards, beyond their useful life and being kept in service at exorbitant cost because there is no alternative.

These vehicles fulfill an increasingly important role in today's society. Transit in the form of community, consolidated or human service transportation has become increasingly important to the disabled and elderly who do not have the skills to drive or can no longer do so safely. It is of these persons to which I would address your attention.

As America becomes older and loses the ability to drive safely, as our disabled population lives longer with conditions which only short years ago would have brought early death, transit must become more specialized to meet their needs. Those needs, of our elderly and disabled citizens, such as medical care, grocery deliveries, are no longer obtainable in the home, as they were to previous generations. Generations are increasingly being separated, as the children leave the home, securing work far from their parents.

As those same parents increase in age and become more enfeebled, it falls upon community/door to door types of transportation to be the last line contact with vital services in the outside community.

Pennsylvania is one of those states which have a rapidly growing elderly population. Today, there are more than 2,000 Pennsylvanians who are age 100 or older. We can expect this number will continue to grow.

For comparatively little additional funds and the union of Sections 16(b)(1) and (2), major impact can be made upon the problems of transporting our older citizens to the vital services needed to keep them active and participating members of our society. The funding to the program has remained stable, but the cost of the equipment has increased by more than 50% over the 15 years of the programs existence.

BIOGRAPHY: VAUGHN E. WHISKER

Vaughn E. Whisker was born and raised in Bedford, Pennsylvania to a family which can trace its roots in the area to colonial days. His sense of duty to community came from parents who remain active in Bedford County and its volunteer activities.

Mr. Whisker earned his Eagle Scout award from the Boy Scouts of America. He graduated from Bedford High School in 1962 where he had been a member of the wrestling team and worked on the school paper. His summer employment was at the Bedford Springs Hotel.

Following his graduation from Mt. St. Mary's College in Emmitsburg, Maryland, Mr. Whisker attended the University of Maryland taking courses in Government and Politics.

Like one of those people referred to in his presentation, Mr. Whisker had to leave his home to find employment. In 1968, Mr. Whisker joined the American Red Cross, Service on Military Installations. Over the next eight years, he served on bases in Vietnam, Germany, Portsmouth, Virginia and Fort Dix, New Jersey.

Employed by West Virginia Governor's Office of Federal State Relations, Mr. Whisker administered such diverse programs as the UMTA Section 16(b)(2) and Federal Flood Insurance Programs. In the Spring of 1976, he was also assigned responsibilities for rewriting and transferring the operational parts of the rural mass transit demonstration program known as TRIP, from the State's Department of Welfare to the Governor's Office. TRIP was the demonstration program which resulted in the creation of the Section 18 rural transportation grant program.

In January 1978, Mr. Whisker become Director of Operations for the Eastern Panhandle Transit Authority. Two years later, he accepted a position to start a transit system in Grand Junction, Colorado. The following year, he became principle transportation planner for Exxon's Colony Oil Shale Project in Western Colorado.

He returned to Pennsylvania, following the shut down of the Colony Project, managing the bi-county paratransit system in Union/Snyder Counties. The following year, 1984, he accepted his current position as Paratransit Administrator for Erie County.

Mr. Whisker was on the Board of STAC, Special Transit Association of Colorado, in 1980 and has been on the Board of PACT, the Pennsylvania Association of Community Transportation, since 1988. He became PACT's President in April 1990. In March 1990, he was elected as State Delegate to CTAA, Community Transit Association of America. He has been Finance Committee Chairman of the American Red Cross Chapter in Grand Junction, Colorado and chaired the Services to Military Families Committee of the Erie County Chapter of the American Red Cross.

In his spare time, Mr. Whisker is a painter of historical miniature figures and a member of a Civil War Round Table.

Mr. Whisker resides in Erie with his wife Cynthia and their son, Vaughn III.

INTRODUCTION

Mr. Chairman, my name is Kevin Flavin. I am Financial Consultant in the Pittsburgh office of Shearson Lehman Brothers. I am pleased to appear before you today on behalf of America's Coalition for Transit NOW. Previously, the coalition has presented testimony touching on the benefit transit can offer in constraining the costs of automobile insurance. Today, Mr. Chairman, I want to focus the Committee's attention on the economic benefits transit can offer to communities and to the nation.

As many have observed, Transit NOW involves a very unusual array of interests. We have come together to support a major increase in federal funding for public transportation. The diversity of Transit NOW's membership demonstrates the breadth of benefits that expanded and improved transit systems and services offer for all Americans.

Too often, Americans think of transit as the way other people get around, if they think about it at all. But as each of us confronts increasing problems of growing reliance on, and cost of, imported oil, congestion, dirty air and inefficient land use, and declining productivity we must come to see that public transportation offers solutions to each of these problems.

I will touch briefly on each of these points and then address the benefits transit offers to our nation's infrastructure and economy.

TRANSIT AND ENERGY

The U.S. is the world's leading debtor nation. A major contributor to our trade imbalance is the growth in oil imports. In January 1990, 54 percent of the nation's oil supply was imported. The impact on our balance of trade is substantial. The Department of Energy recently reported that in the first 11 months of 1989, the cost of imported energy, nearly all oil, represented 38.5 percent of the $102.4 billion trade deficit in those months. Transportation accounts for 65 percent of petroleum use. Reducing the use of oil products for transportation by increasing the use of shared ride modes of transportation will result in a decline in the demand for imported oil. For instance, 30 million to 40 million gallons of gasoline would be saved each day if average commuter vehicle occupancy were increased from 1.1 passengers per vehicle to 2.1 passengers per vehicle.

TRANSIT, CONGESTION AND PRODUCTIVITY

Everywhere, congestion is a major cause of declining economic productivity. Nationally, 2 billion hours are wasted each year while we sit in traffic. In the next 20 years urban and suburban travel is projected to increase by 400 percent on the nation's freeways, and by 200 percent on other roads.

And as congestion diminishes our productivity, our economic competitors are making massive investments in their transportation infrastructure:

- Spain is investing $22 billion to rebuild its national rail network.
- West Germany is investing $12 billion to build an intercity high-speed rail network.
- Scandinavian countries are building Scanlink at a cost of $6 billion to connect Scandinavian rail and road systems to Europe.
- Switzerland is spending $8 billion to build trans-Alpine rail tunnels to Italy and an additional $5 billion on a new rail and bus network.
- The British and French are building the Channel Tunnel at a cost of $12 billion to accommodate 80 mph rail traffic.
- The French high-speed rail network is being expanded to Lille and Calais tying France, and all of Europe, into a network including Brussels, Amsterdam, Cologne and London.

These figures are just for the emerging European Community. Japan's bullet trains are legend, and they, too, are being expanded and improved.

Mr. Chairman, for too long the only transportation choice for too many people has been "one person per car." The consequence is seen in the daily congestion found in every American city.

Mr. Chairman, we can't continue down this road.

TRANSIT, ENVIRONMENT AND HEALTH

Similarly, the quality of our air has declined in virtually every community. As a result, our environment and our health have suffered. It is well documented that the major source of air pollution is motor vehicles.

- One third of carbon dioxide -- the most significant cause of global warming -- comes from transportation sources.
- Transportation sources cause 40 to 60 percent of pollution that produces ozone. Ozone standards were violated regularly in 101 U.S. cities in recent years.
- Transportation also accounted for 70 to 80 percent of carbon monoxide emissions, with those standards being exceeded in 44 metropolitan areas.
- A consequence of this motor vehicle pollution is 110 million Americans breathing dirty air, according to the federal Environmental Protection Agency.
- The cost to our health is staggering, with over $40 billion spent on air-pollution related illnesses each year. The American Lung Association reports that auto pollution is a major factor in the deaths of 110,000 people yearly.

Mr. Chairman, we can't continue down this road.

We all hope that the soon to be enacted Clean Air Act will improve our air quality. But even these efforts will not be enough. Integral to our nation's efforts to clean the air must be a renewed commitment to making public transit available to all Americans, to offering meaningful transit choices other than one person per car.

MOBILITY

Economic competitiveness and air quality are not the only reasons America needs an improved public transportation system.

For 65 million transportation disadvantaged Americans -- people with disabilities, older Americans and rural residents in particular -- our under funded transit system has meant less mobility and fewer opportunities to contribute to society and maintain their independence. Limited public transit also condemns many rural communities to slow economic death.

TRANSIT, INFRASTRUCTURE AND ECONOMICS

Mr. Chairman, historically, the federal government has played a major role in capital formation in the United States. Through its funding of public infrastructure facilities--transportation, water, and sewer systems--it has channeled dollars into public assets which create wealth and contribute to our country's economic prosperity. These federal investments have made it possible for states, local governments and private enterprise working with firms like mine to add to this capital formation.

Recent studies done by David Aschauer of the Federal Reserve Bank of Chicago show the close linkage between those public investments and private investments and productivity. For example, a mere one percent increase in the stock of infrastructure capital raises the rate of return to all private non-financial corporate capital by about 10 basis points (one-tenth of one percent).

Yet the federal government's investment in infrastructure in the United States has not kept pace with economic growth in recent years. The federal government's investment in physical capital as percent of its total outlays has been reduced by more than half since 1960--from 24% to 11%. Transit projects have fully shared in this severe

reduction. Federal outlays for transit during the 1980's have declined substantially, in both actual and constant dollars. In 1981, federal transit assistance was $4.6 billion. Today, it is only $3.2 billion. The American Public Transit Association's estimates show that to reach the 1981 funding level of $4.6 billion in today's dollars would require that the current $3.2 billion funding be more than doubled. The goal of the Transit NOW coalition is to secure this kind of funding.

Any sound capital program requires regular, continuing investment. Existing infrastructure must be continually replaced and, where economic growth requires, supplemented. We have always known that it is a mistake to defer investments in infrastructure in the foolhardy belief that those investments can be deferred into some hoped for tomorrow when there will be more funding available. Experience teaches us that lesson every day. The Interstate Highway Systems is a good example--a large outlay for the initial investment, with no program for the investment required to maintain the systems and protect that initial investment, has left us with a crumbling highway systems.

During the past twenty years, the nation has begun to make a significant investment of public dollars in transit. To walk away from that investment by ignoring the need for a regular and sustained investment program would be foolish. If the investment does not continue, we will be doubly penalized: we will lose the billions we have already wisely put into transit needs, and we will fail to exploit the opportunity for greater economic prosperity that, as Aschauer has shown, additional investment will produce.

CONCLUSION

Mr. Chairman, the evidence is compelling. Greater use of mass transit and improved mass transportation systems will lead to a reduction in congestion, increased productivity, increased energy conservation, improved air quality, wiser land use, better mobility, fewer accidents, injuries and fatalities, and infrastructure investments which will benefit the private sector, and all Americans, in important ways.

Shearson Lehman Brothers and others in our industry have a vested interest in these issues and will continue to work with organizations with similar goals such as those of Transit NOW. We are proud to join with business, labor, consumers and transit providers in urging increased funding for mass transit.

Mr. Chairman, recently the voters of California approved three ballot initiatives which authorize $3.79 billion to be invested in new mass transit infrastructure. In recent years, most other states have also invested in the improvement and expansion of the public transit systems and services. It is likely that in the near future, the State of Pennsylvania will develop a dedicated source of funding for transit. Now it is time for the federal government to follow the lead of the states and be not only a rhetorical partner but also a fiscal partner in revitalizing our nation's public transit systems.

The members of the Transit NOW coalition and Shearson Lehman Brothers urge you and your colleagues to lay the public policy ground work for transit into the 21st century.

Mr. Chairman, we need more Transit NOW!

Mr. Chairman thank you for the opportunity to appear before the Committee, and I would be happy to answer any questions you or the other Members of the Committee may have.

VICE CHAIRMAN
TRANSPORTATION

To the Surface Transportation Subcommittee,
Committee of Public Works and Transportation,
U.S. House of Representatives

The number one transportation priority in Somerset County is the completion of U.S. 219 from Somerset to Maryland as a four-lane, limited access highway.

Although the highway was originally planned to run from the New York to the Maryland borders, only the section from Ebensburg to Somerset has been completed. As the result of an allocation of federal funding, work is currently underway on the Ebensburg Bypass, which will be the first extension of the highway since the 1970's.

The "missing link" from Somerset to Maryland is 22 miles long. Although the Commonwealth owns part of the right-of-way and completed environmental and design work on some sections in the 1970's, additional land purchases are necessary and the environmental and design work must be updated to meet changes in federal law.

Earlier this year, Governor Casey announced his plans to build a 3.8 mile portion of the "missing link" around Meyersdale Borough. State funds have been released to carry out the environmental update. Congressman Murtha has pledged $48 Million in federal funds toward the total project cost of $60 Million.

Estimates of the cost to complete the entire 22 mile "missing link" have ranged from $10 Million to $20 Million per mile. Realistically, a highway construction project with such a large price tag cannot be completed in a reasonable time period without a major infusion of federal funds.

Ideally, Somerset County residents would prefer to have this highway completed as a toll-free expressway through a combination of federal and state funding. However, if it were necessary, the road could be built as an extension of the Pennsylvania Turnpike. If the toll road scenario is the option which must be selected, it would be extremely helpful if the U.S. Congress were to waive the prohibition on using federal funds to construct a toll road. A similar waiver in 1987 was a major factor in reviving the Mon Valley Expressway project.

Completion of U.S. 219 from Somerset to Maryland is crucial for several reasons.

First, the southern part of Somerset County is currently linked to the county seat, the Turnpike, and the heaviest population concentration by an inadequate two-lane U.S. 219 which has numerous curves and hills. In fact, most local residents use the Garrett Shortcut to eliminate part of U.S. 219 south of Somerset, but the Garrett Shortcut has numerous hills and is an especially dangerous highway in bad weather.

Because of the hills and curves on the existing highway, there are only a few passing zones. Major tie-ups are common, especially when a loaded coal truck or other big truck is at the head of a line of traffic.

Construction of a four-lane, limited access highway would not only enhance highway safety and motorist convenience, but it would also make it easier to persuade new businesses to locate in the economically depressed southern portion of Somerset County.

Second, completion of U.S. 219 from Somerset to Maryland would link the Pennsylvania Turnpike to U.S. 48 and Interstate 70. Maryland is working on the final section of the U.S. 48 expressway between Cumberland and Hancock. When that section is completed, U.S. 48 will be designated as an interstate highway from Morgantown, West Virginia, to Hancock, Maryland, and will connect Interstate 79 with Interstate 70. Completion of U.S. 219 would make it easier for Somerset County to tap into the economic development potential provided by U.S. 48 as well as provide an alternative route for some eastbound traffic on the Pennsylvania Turnpike which faces a growing bottleneck at the Allegheny Tunnel east of Somerset.

Third, completion of U.S. 219 from New York to Maryland would be a critical link on the most direct route from Canada to Baltimore, Washington, and the southeastern seaboard. Somerset County is due south of Toronto, Canada, and Buffalo, New York. U.S. 219 connects Somerset County to Buffalo. With the U.S.-Canada free-trade agreement and with the increasing number of Canadians who spend their winters in Florida, completion of the U.S. 219 expressway would put Somerset County on what would become one of the most heavily travelled north-south highway networks in North America. The economic development potential would be substantial.

In view of the foregoing, I strongly urge you to allocate federal funds for the completion of U.S. 219.

TESTIMONY OF REPRESENTATIVE EUGENE G. SALOOM
26TH LEGISLATIVE DISTRICT
PENNSYLVANIA GENERAL ASSEMBLY

SURFACE TRANSPORTATION SUBCOMMITTEE HEARING
SEPTEMBER 17, 1990 IN EBENSBURG, PENNSYLVANIA

CONSTRUCTION OF THE LAUREL VALLEY EXPRESSWAY

TO BE PLACED IN OFFICIAL RECORD OF THE HEARING

MY PURPOSE IN ADDRESSING THE SURFACE TRANSPORTATION SUBCOMMITTEE OF THE U.S. HOUSE OF REPRESENTATIVES IS TO EXPLAIN WHY THE LAUREL VALLEY EXPRESSWAY IS NECESSARY FOR THE FUTURE EXPANSION AND ECONOMIC GROWTH OF WESTMORELAND COUNTY, IN PARTICULAR THE EASTERN SECTION.

EASTERN WESTMORELAND COUNTY STANDS AT THE THRESHOLD OF A NEW ERA AS THE SONY PLANT, FORMERLY THE VOLKSWAGEN PLANT, IS SCHEDULED TO BECOME OPERATIONAL WITHIN THE NEXT TWO YEARS AND A INDUSTRIAL PARK IS ALSO BEING DEVELOPED AT THE SITE, HOWEVER, IF THIS EXPANSION IS TO CONTINUE WE NEED BETTER ROADWAYS. THE CONSTRUCTION OF THE LAUREL VALLEY EXPRESSWAY WILL ENSURE THE CONTINUED GROWTH THIS COUNTY NEEDS.

IN 1967, WHEN THE ORIGINAL PLANS WERE BEING DISCUSSED ON THE DEVELOPMENT OF THE EXPRESSWAY, I WAS TOTALLY SUPPORTIVE OF THE CONCEPT, AND NOW SOME 20 YEARS LATER GENE SALOOM IS STILL SUPPORTIVE OF THE LAUREL VALLEY EXPRESSWAY.

THE PROPOSED FOUR-LANE LAUREL VALLEY EXPRESSWAY STRETCHING FROM ROUTE 22 NEAR BLAIRSVILLE TO NEAR SCOTTDALE, WITH A NEW INTERCHANGE ON THE PENNSYLVANIA TURNPIKE AT CARPENTERTOWN WILL PROVIDE A VITAL NORTH-SOUTH CORRIDOR IN THE COUNTY.

CURRENTLY, EASTERN WESTMORELAND COUNTY HAS NO ADEQUATE NORTH-SOUTH CORRIDOR FOR ROUTES 30, 22 AND THE TURNPIKE, WHICH PLACES HARDSHIPS ON INDUSTRIES AND BUSINESSES IN THE AREA. TO MAKE THE ABOVE CONNECTIONS ROUTES 981 AND 982 MUST BE UTILIZED. THESE ROADS ARE INADEQUATE, NOT ONLY BECAUSE OF THEIR TWO-LANE CONFIGURATION, BUT BECAUSE THEY ARE WINDING.

TRUCKERS AND MOTORISTS DRIVING ON THESE ROADWAYS FACE DANGEROUS CONDITIONS LURKING AROUND EVERY CURVE. FOR EXAMPLE, ON ROUTE 31 IN THE AREA OF THREE-MILE-HILL, SIGNS ARE POSTED INSTRUCTING TRUCKERS TO PROCEED AT 20 MILES-PER-HOUR IN LOW GEAR THROUGH THE DANGEROUS AREA; HOWEVER, NUMEROUS ACCIDENTS STILL OCCUR ON THIS ROAD.

ACCORDING TO THE PENNSYLVANIA TURNPIKE COMMISSION, JANUARY 1, 1990 THROUGH AUGUST 31 1990, BOTH MOTORIST AND TRUCK TRAFFIC THROUGH EASTERN WESTMORELAND COUNTY IS HEAVY, WITH 120,616 TRUCKS AND 307,382 PASSENGER VEHICLES ENTERING THE TURNPIKE AT NEW STANTON AND 114,024 TRUCKS AND 314,854 VEHICLES EXITING THE TOLL ROAD.

DURING THE SAME PERIOD OF TIME, AT THE DONEGAL INTERCHANGE, SOME 7,738 TRUCKS AND 79,728 MOTORISTS ENTER THE ROADWAY AND, 8,156 TRUCKS AND 84,227 PASSENGER VEHICLES LEAVE THE TURNPIKE.

FOR MOTORISTS ENTERING THE TURNPIKE AT NEW STANTON AND DONEGAL AND HEADING EAST THE TRAFFIC VOLUMES ARE EVEN HEAVIER. ACCORDING TO 1989 TURNPIKE FIGURES, THERE IS A CONCENTRATED VOLUME OF TRAVELERS HEADING EAST ON THE TURNPIKE WITH 2,238,886 VEHICLES ENTERING AT NEW STANTON ALONG WITH 216,572 VEHICLES ENTERING AT DONEGAL.

THE CREATION OF THE LAUREL VALLEY EXPRESSWAY WILL PROVIDE A NORTH-SOUTH CORRIDOR FOR THE HEAVY TRAFFIC TRAVELING TO THE TURNPIKE, ESPECIALLY THOSE HEADING EAST.

ANOTHER IMPORTANT ASPECT OF THE LAUREL VALLEY EXPRESSWAY IS THE POSITIVE IMPACT THE NEW ROADWAY WILL HAVE ON BUSINESSES. INDUSTRY WILL PROFIT FROM THE ACCESSIBILITY OF THE NORTH-SOUTH CORRIDOR GOING THROUGH THE COUNTY.

THE ECONOMIES OF BLAIRSVILLE, LATROBE, DERRY AND MOUNT PLEASANT WILL ALL BE STIMULATED BY PROVIDING UNRESTRICTED NORTH-SOUTH TRAVEL BETWEEN THE MAJOR EAST-WEST ARTERIES OF THE AREA.

IN THE NORTHERN SECTION OF THE LAUREL VALLEY EXPRESSWAY, BLAIRSVILLE INDUSTRIES SUCH AS METAL CONVERSION, BLAIRSVILLE MACHINE PRODUCTS, BENTLEY COAL AND WESTINGHOUSE WILL MOST ASSUREDLY BENEFIT FROM THE EASY ACCESS TO THE TURNPIKE AND CONNECTIONS INTO THE NORTHEAST MARKET AREA.

THE LATROBE-DERRY AREA BUSINESS COMMUNITY WILL DEFINITELY EXPERIENCE CONTINUED EXPANSION WITH CONSTRUCTION OF THE LAUREL VALLEY EXPRESSWAY.

FOR INSTANCE, KENNAMETAL INC. HAS BEGUN CONSTRUCTION OF A 150,000 SQUARE-FOOT BUILDING AT THE INTERSECTION OF ROUTE 981 AND 950 IN UNITY TOWNSHIP, JUST OUTSIDE OF LATROBE.

OTHER LATROBE-DERRY AREA INDUSTRIES SUCH AS LATROBE STEEL, TELEDYNE VASCO, LATROBE BREWING CO., INDUSTRIAL CERAMICS INC. AND KALUMETALS INC. WILL ALL BENEFIT FROM AN IMPROVED ROADWAY SYSTEM THROUGHOUT THE COUNTY.

THE WESTMORELAND COUNTY AIRPORT'S MARKET VALUE WILL BENEFIT IMMENSELY BY THE CONSTRUCTION OF THE ROADWAY. PRESENTLY, I AM LOBBYING TO HAVE THE PENNSYLVANIA NATIONAL GUARD 112TH TACTICAL AIR FIGHTER SQUADRON PERMANENTLY RELOCATED FROM PITTSBURGH TO THE WESTMORELAND COUNTY AIRPORT.

ADDITIONALLY, AN INDUSTRIAL PARK IS PLANNED FOR LAND LOCATED ADJACENT TO THE AIRPORT. COMPANY'S MAINTAINING AN OFFICE AT THE INDUSTRIAL PARK WILL HAVE EASY ACCESS TO COMPANY PLANES HOUSED AT THE AIRPORT.

THE AREA SURROUNDING THE AIRPORT IS CURRENTLY EXPERIENCING A BUILDING SPURT WITH A SHOPPING COMPLEX BEING CONSTRUCTED ALONG WITH SEVERAL FAST FOOD CHAINS. THE CORRIDOR NEAR THE AIRPORT IS EXPANDING AND WITH THE CONSTRUCTION OF THE EXPRESSWAY THIS EXPANSION CAN ONLY CONTINUE.

THE RECREATIONAL AREA IN WESTMORELAND COUNTY SUCH AS FORT LIGONIER, FALLING WATERS, LOCAL AMUSEMENT PARKS AND SKI RESORTS WILL ALSO REAP THE FINANCIAL REWARDS OF THE CONSTRUCTION OF THE EXPRESSWAY. BETTER ROADWAYS WILL BRING MORE TOURISTS INTO THE COUNTY, THEREFORE, GENERATING MORE REVENUE IN THE COUNTY.

IN CLOSING, I MUST STRESS THAT WITH BETTER ROADWAYS INDUSTRY WILL BE ATTRACTED TO WESTMORELAND COUNTY AND EXISTING BUSINESSES WILL NOT LEAVE THE AREA FOR GREENER PASTURES. CONSEQUENTLY, THE EMPLOYMENT LEVELS WILL RISE THROUGHOUT THE AREA.

THE CONSTRUCTION OF THE LAUREL VALLEY EXPRESSWAY WILL HELP THIS COUNTY EXPAND AS WE PROCEED THROUGH THE 90'S AND PROVIDE A BETTER LIFE FOR OUR CHILDREN -- THE FUTURE OF WESTMORELAND COUNTY.

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

FRIDAY, SEPTEMBER 21, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Durham, NC.

The committee met, pursuant to call, at 9 a.m., in the Microelectronics Center of North Carolina, 3021 Cornwallis Road, Research Triangle Park, Durham, NC, Hon. Norman Mineta (chairman of the subcommittee) presiding.

Present: Representatives Mineta, Valentine, and Price.

Mr. MINETA. Today, the Subcommittee on Surface Transportation continues its field hearings to help determine the sum and substance of the future Federal-aid highway, mass transit, and highway safety programs once the current programs expire on September 30, 1991.

During the past 34 years, Americans have enjoyed a tremendous Federal investment of more than $270 billion in our Nation's transportation systems.

We have built more than roads and bridges, interstates and mas transit systems.

We have built a way of life that has sustained the American people and fortified our economy.

But what of tomorrow—especially in high-growth States like North Carolina where transportation plays such a key role?

For tomorrow, we must make certain that Americans can travel safely. We must move people and goods in a way that will improve our economic competitiveness, the quality of our air, and our overall quality of life. And we must leave no doubt in the minds of our children that we will act consistently, and with foresight.

Americans now travel more than 2 trillion miles on our highways each year. In the future, that level will only rise. And yet it is estimated that as a nation we will need to invest more than $95 billion annually just to maintain the current level of service through the year 2020.

The question is: Where will we get the money, and how should we use it?

Clearly, the strong partnership that already exists among the American people, business, industry and all levels of government will be called upon to meet the challenges of building and rebuilding our transportation systems.

But, at the same time, we must never lose sight of the fact that how we spend that money is as important as how much money we spend.

More than a year ago, the Subcommittee on Surface Transportation set a legislation agenda to build the transportation future America wants and needs.

We have conducted hearings in Washington, DC. We have received expert testimony. But the health and well-being of our transportation network requires more hands-on input than any series of Washington hearings could provide.

This is why we are here today in North Carolina.

It is also fitting that we hold a field hearing in Durham in view of the major role played by your Representative Tim Valentine on the Surface Transportation Subcommittee.

I know how proud you must be of Tim. As a committee colleague, I can personally vouch for how tirelessly Tim works to improve the well-being of the Second Congressional District.

Since he joined the Congress and the Public Works and Transportation Committee in 1983, Tim Valentine has demonstrated his expertise on every mode of transportation—including highways and aviation.

I know I will be looking to your Congressman during the next 13 months as we craft the national transportation assistance programs to bring us into the 21st century.

There is much that we need to do in this legislation.

In the 1960's and 1970's, we spent more than 2.3 percent of our annual gross national product on our transportation network. In the 1980's, that level shrunk to four-tenths of 1 percent.

The result has been congestion on our highways, deficient or functionally obsolete bridges, substandard pavement, and decay of our mass transit systems.

And the lesson is clear:

Transportation programs must never again be underfunded as they have been in the recent past.

In the 1990's, I believe the key to finding solutions to our Nation's transportation problems will be to define the appropriate Federal role.

I believe that Federal role must take into account State and local needs, program flexibility, and the right of people who have paid taxes into the transportation trust funds to get what they've paid for—and not see those funds idle away at the same time there's talk of increasing the Federal gas tax.

Through this hearing, I am confident that we will further our efforts to determine what the Federal role should be in the future, and to identify how we get there from where we are today.

Let me thank today's witnesses in advance for their testimony, and offer special thanks to Representative Valentine for inviting the subcommittee to visit the fine city of Durham and North Carolina's Second Congressional District.

At this time, I would like to yield to our very fine colleague from North Carolina's Second District, Congressman Tim Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman. I appreciate your yielding to me at this point. I want to say to everyone here that we are delighted to welcome our good friend, Chairman Norman

Mineta to this district and to the State of North Carolina. And also, words of welcome to Surface Transportation Subcommittee staff—welcome here also. A number of our witnesses are from states other than North Carolina, and I am pleased to welcome them here also.

I know that I speak for all North Carolinians who are interested in transportation issues in expressing my thanks to Chairman Mineta for bringing the subcommittee here to our State for this occasion. And expressions of thanks to the officers and the staff of MCNC is also in order. President Matt Ewing, George Howell, Gaynell Pope, Jeanette Edmondson, and many other MCNC personnel have worked hard to ensure that we have an excellent facility and outstanding support for this hearing. Finally, I want to thank North Carolina Secretary of Transportation, Tommy Harrelson, and his staff, Larry Simms, Hannah Byron and a host of other department of transportation staff members who have made essential contributions to this proceeding.

This is an important occasion for our state. The reauthorization of Federal-aid highway, mass transit and highway safety programs is a matter of great consequence to this State. This hearing is a singular opportunity for the subcommittee to explore and develop a better understanding of the challenges facing North Carolina and other States in the Sunbelt. We will hear a number of critical transportation issues today—the transportation and infrastructure needs in individual States and the Nation; the need for revision of funding formulas for Federal highway and mass transit programs; the need for improvements in safety, especially in our highways and others.

We recognize the fact that the ability to have this type of hearing, your subcommittee, is much sought after—sought for—and you could not go everywhere in the Union, and we are pleased that you afforded us this opportunity.

We have here before us also and I want to add my word of personal welcome to our distinguished Governor, who is our former colleague, who is doing an outstanding job and who will give us the benefit of his judgment. And with that, I will yield again to the chairman. Thank you.

Mr. MINETA. I am pleased to yield at this time also to a very fine colleague, Congressman David Price.

Mr. PRICE. Thank you, Mr. Chairman. I would like to share in Mr. Valentine's welcome of the witnesses to this part of North Carolina. I do have a brief opening statement to make, but I would like to defer that until we get to the Governor. I know he is on a tight schedule, and I would be happy to hear from him at this time and then, I would appreciate the chance to say a few words.

Mr. MINETA. Very well. At this time, then, I would like to introduce a very fine former colleague of ours who is now the Chief Executive Officer of the great State of North Carolina, the Honorable Governor Jim Martin. Jim, it is good to have you before us and to have you take the time to be here.

TESTIMONY OF HON. JAMES G. MARTIN, GOVERNOR, STATE OF NORTH CAROLINA

Governor MARTIN. Thank you, Mr. Chairman. I want to join with Congressmen Tim Valentine and David Price in welcoming to North Carolina the distinguished chairman of Public Transportation Subcommittee on Surface Transportation for these hearings here today, Norman Mineta. A good friend the time that I served there in the Congress. We welcome you to the Tarheel State.

The reason I emphasize that is because there have been a lot of meanings. Back in Colonial Days, we were the Tarheel State because we did not have shoes and got pine tar on our feet, and it showed it—it was a give-away and it was a put-down. The term acquired a different meaning after the "War Between the States," which did not involve your State at the time. But which did involve ours. Because of tenacity, we could not move with all of that tar on our heels.

Mr. MINETA. My great grandfather, Beauregard Mineta——[Laughter.]

Governor MARTIN. He is from Savannah.

Mr. MINETA. That is right. He is from Savannah.

Governor MARTIN. We are going to put a new meaning on it. We have just enacted a $9.2 billion State-funded highway construction program that passed in 1989, and you are going to hear from the legislative author, Senator Bill Goldston, a little later in these hearings. But it gives that slogan a new meaning—a new credence. If you notice a little fresh asphalt on our heels that is because it is mostly state tar, with a little Federal tar mixed in.

But, I am pleased to be with you this morning as we begin to deal with this issue, which affects every one of us at some time or other. I want to say that the importance of what you are trying to accomplish was said very well a few days ago, and I want to quote.

> I believe the United States must enter the 21st century with a transportation network that is second to none in an increasingly competitive world. That means we must first redefine our transportation programs to meet the challenges of the 1990s. I believe we must look at the reauthorization of the federal transportation programs from a broader perspective than we have in the past. I believe we must define our efforts in terms of how they aid our international competitiveness, foster domestic economic development, improve public safety, enhance our overall quality of life and provide a stable, consistent level of funding.

These are comments that I quote from a statement made by Chairman Mineta recently as he announced a new initiative for the national surface transportation reauthorization policy, and I fully agree and incorporate those remarks, as well as my own.

There is a lot to talk about, and a lot of people who are going to be scheduled to speak, so I want to get right to the point, Mr. Chairman. Through State, Federal, and local government partnerships, North Carolinians have invested an estimated $66 billion in our extensive highway system. And yet, we recognized several years ago, that to cope with our current economic success and prepare to meet the challenges of the next century, we needed to invest even more. We needed a program that addressed our most pressing and immediate needs and one that planned for all of North Carolina to share in a brighter future. So last year, our State made that kind of commitment to transportation with the en-

actment of the largest public works program in our history, the $9.2 billion over 13½ years. That is all State money. This was in addition to our normal highway and transportation improvement budget, including State, and Federal money.

It will pave all our dirt roads and complete a 3,000-mile uninterrupted network of four-lane divided limited access highways that will reach within ten miles of 96 percent of our people. It is, in effect, an intrastate system, so that every area of North Carolina will have an opportunity to participate in effective economic development for better jobs for our people.

What we are doing is making North Carolina a better place to live and to work, and we are making it easier and safer for people to get to work. We want to bring jobs to the people. We want to help people get to the jobs in the congested areas. So that with this system, with buses to transport children to school, connections—paving the dirt roads so that our farmers can get their produce to market, so that businesses can move their products and get there just in time for inventories and to help our people enjoy their leisure time with the travel and tourist attractions of our State.

On the State level, we are trying to do our part. However, a fair Federal transportation program is essential to the success of any State transportation plan—this State or any other. One element of a fair Federal transportation program would be the orderly spend-down of the trust fund balances. I would advocate that to you and encourage you in that direction. More than $10 billion is sitting in the U.S. Treasury in an effort to disguise the true level of the Federal fund deficit. Taxpayers have contributed to the Federal trust fund thinking their money would be used to address transportation problems nationwide, and of course, some of it has; but, that surplus has not. And this money could be well spent on a backlog of critical transportation needs, such as unsafe bridges, relief of congestion in our cities, better access to our rural areas. The highway trust fund should be removed from the unified Federal budget process, in my opinion, so that its surplus is not used for the appearance of balancing the deficit. The trust fund is a dedicated revenue source for transportation programs and projects of that sort and should be taken off the general budget and made independently reportable and accountable.

The new Federal program that you are beginning to design also would be well served to omit the so-called demonstration projects. I have talked with the Chairman about this subject. Among the States and within the American Association of State Highway and Transportation Officials, opposition to the practice is virtually universal. However, once it is started, the pork barrel flavor of it initiates a free-for-all among States in their congressional delegations. The process distorts the distribution of funds at the national level and detracts from decisionmaking and planning at the State level. I would say that if Congress were to insist on continuing the practice of the demonstration grants that each State's demonstration grants ought to come out of that State's normal fair allocation so that we would each still get our fair share.

Highway safety will be another important element in the new Federal program. I see the key to the national safety program to be more local and State flexibility, again, in using the safety money,

38-253 O—91——99

as well as dedicated and secure sources of funding for the long-term development of projects and requests.

As far as the current total Federal program is concerned, North Carolina has a rather dubious distinction. Our State has received the smallest proportion of Federal highway funds over the cumulative history of the highway trust fund. We are not a wealthy State; but we have been made a donor State. North Carolina is also a fast-growing State and the 10th most populous State and should not receive fewer Federal dollars than taxes contributed. A fair Federal program ought to ensure more equitable distribution of funds.

While we are on the subject of equity, I cannot help but mention the fact that North Carolina contributes $40 million a year to the mass transit account and gets back $2 million, for the $38 million difference in money that could be spent getting more of our handicapped people to the store and to the doctor. It is money that could be spent getting more elderly citizens to places they need and want to go when they are no longer able to drive. It is money that could be spent on a variety of mass transit alternatives. It is money that should be returned for use by its contributors, and we only ask for our fair share.

The public transportation need in North Carolina is different from many States of similar size. Our low-density cluster type cities are not suited for the billion dollar mass transit rail projects. But we do, as a State, own a railroad corridor and the right of way and the track from Charlotte to Greensboro to Raleigh to Morehead City on the coast and are now promoting rail passenger service with our own money. A fair Federal program would provide more flexibility in how that money could be spent.

Mr. Chairman, if there is a theme for the new Federal transportation program, I hope it would be, "Fairness and Flexibility." Because without those two vital elements, we would not have a great deal of interest in a Federal program. I know from the days that I spent in your midst that the decisions you will have to make and the debates and the persuasion that you will have to bring to bear on it will be difficult. But working together, I believe that we can develop a new Federal surface transportation program to meet the needs of the future for the entire Nation. Just be fair.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Governor. I want to congratulate you for not only the fine job you did as a member of the House; but the leadership you are showing now as the Chief Executive Officer here and the $9.2 billion program that you have indicated. As I recall, your gasoline tax here in the State is one of the higher ones in the country. But I think—when I reflect on the area I represent, which is Silicon Valley, and then I look at the area here and the kind of growth that you have seen in the Triangle City area, as well as the State of North Carolina—I can very well appreciate what the needs are in trying to balance the needs of the people, the jobs it creates and the infrastructure. And when I talked about economic development, I am really talking about local and State economic development. So, I am really interested in what can this bill do that we—as we look at this new legislation. What

will that legislation do to help local and State economic development?

So, again, I am very appreciative of your comments, especially as it relates to demonstration programs. I remember when we had that discussion at the National Governors' Association. And so, I appreciate your comments on that.

Let me——

Governor MARTIN. Mr. Chairman, you mentioned the high gasoline tax, and one point that I would make that I think would be useful in this hearing is that, yes, it was increased, along with taxes on automobiles and trucks so that we have more highway user taxes to apply to highway uses. And that tax increase has been relatively—as everything is—but, relatively very well received by the people of this State because they know they are going to get their money's worth. They know that they will get a network of highways that will treat everybody fairly.

Mr. MINETA. One of the things that always comes up in this whole issue is fairness. And, this is where, frankly, Congressman Valentine—not to be a pain—but has been very forceful in bringing to our attention the fact that the State of North Carolina is not getting its fair share of Federal highway trust fund revenues. Now, the existing minimum allocation program provides for an 85 percent return to the States. Now, in your view, what is a fair return of the highway trust fund for the State of North Carolina?

Governor MARTIN. Mr. Chairman, again, it is relative. Anything would be fairer than what we are getting. That 85 percent is 85 percent of 75 percent, I believe. It is like Boss Hogg in the Dukes of Hazzard. "You get 10 percent of 10 percent." And when you think about it, that is only 1 percent. What our situation is, that even after all of our access to discretionary funds, we end with up sending about $400 million a year to the Federal highway trust fund to get back about $300 million a year. We are in last place in respect to the amount that we get. If there were no demonstration grant programs, then of course, 85 percent would be a higher fraction of what we get back. But, we do not see any reason why it should not be a fair 100 percent share.

We try to do that with our State. In getting support for the $9 billion program, we negotiated with the legislators and county commissioners and the highway board members—the board of transportation members—all over the State a fair distribution so that everyone would get a share that they could count on, and we worked out a way so it would be dependable. Not as a campaign promise, but as part of the law.

Mr. MINETA. The subcommittee, as it considers proposals to restructure the formulas for apportioning Federal aid highway funds, we look at a number of factors, such as lane miles, population, fuel consumption, a number of other factors. And the State of North Carolina has one of the highest diesel fuel consumption levels in the Nation. Should the committee consider diesel fuel as a factor for the apportionment of Federal aid highway funds?

Governor MARTIN. Mr. Chairman, I would treat it all the same. Whatever the source of taxes, it ought to be on highway users for the purpose of improving the highways that they use. And perhaps,

I missed a point of your question, but I think it ought to be treated the same.

Mr. MINETA. The—well, one of the things that I——

Governor MARTIN. We just want our share.

Mr. MINETA. Right. One of the things that as we talk about alternative energy, as an example, the question of whether or not diesel or methanol or ethanol are paying their fair share to the highway trust fund will be coming up as an issue. Of course, North Carolina is a big diesel fuel consumer through trucking industries, et cetera. So, I think that will have to be a factor we will take a look at.

Governor MARTIN. Mr. Chairman, I am familiar with all of that. But yet, the trucks use the highways. That is where they consume that diesel fuel. And if—according to the engineers—per mile traveled—in fact, per gallon consumed, there is more damage accumulated in the structure of the highway system than for automobiles because they are much lighter. I do not think that there ought to be a distinction. If you were to provide all the distinctions to encourage diesel and alcohol-based fuels, pretty soon, you would not have money to build your highways. And so, you would have to go back to taxing those instead.

Mr. MINETA. The gasoline tax here is, what, 12¾ cent per gallon?

Governor MARTIN. Mr. Chairman, it is——

Mr. MINETA. Is it 21 cents?

Governor MARTIN. It is just 20—20.5, 21 cents, depending on the part that is based on the wholesale price. Part of it is a flat cents per gallon, and part of it is based on the wholesale price, so that there is an inflation factor in it, but it is 21 cents——

Mr. MINETA. So, whether that is gasoline or diesel, it would still be paying the same gallonage?

Governor MARTIN. That is right. I think that is fair. You could make an argument for charging more because of the tonnage and the load that that requires you to build into your highway. The load factors that have to built into your bridges and highways that the cars do not need.

Mr. MINETA. Well, that is always my point is that regardless of how the car or truck is fueled, it still occupies the same space. It still occupies the same weight or impact in terms of bridges and highways and ought to be paying its fair share.

Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman.

Governor Martin, North Carolina is still, I believe, the most rural State—whatever that means today. We have no real population centers such as exist in other parts of the Union, with apologies to Charlotte for that. But, the point is, is it not true that of the money that we send—of the money that we send to the Federal Treasury for mass transit—for every dollar we send, we get a nickel back, approximately?

Governor MARTIN. That is about all.

Mr. VALENTINE. And that is——

Governor MARTIN. Two million out of $40 million—a nickel on the dollar.

Mr. VALENTINE. And it is that way because of the fact that they take the position—the people who administer that program in Washington—that mass transit means the operation of trains on

rails. And that does not take into account the special needs of a population such as exists in North Carolina. To us, mass transit is also the movement of people in buses. And that is—presents a real problem, does it not?

Governor MARTIN. Yes, it does, Congressman. We also have a number of cities in both of your districts and across the State that are looking at mass transit systems that would move traffic—move people in and out and around the business centers of Durham and Raleigh and Charlotte and Greensboro and Winston-Salem, Wilmington, Fayetteville, Asheville—they are looking at those more localized kinds of mass transit systems. But in addition, we have the railroad that I mentioned before—the North Carolina Railroad—on which we are developing rail passenger service to connect those cities.

We do not have a single city that is dominant in size. In fact, you mentioned Charlotte. Its percentage of our State's population is the smallest of the 50 States. Every other State has a city with a higher percentage of the State population than does Charlotte. That is because we have a lot of scattered, diversified cluster arranged cities.

Mr. VALENTINE. This is not a problem that has just come to the fore in the past year or two. This has existed for a number of years, has it not?

Governor MARTIN. We see that as an advantage, rather than a problem. But it has its special needs in transportation.

Mr. VALENTINE. I am talking about the distribution of this mass transit money. We are not talking about this——

Governor MARTIN. The distribution of the mass transit money has been a problem ever since it was created, for us. It has not been much value to North Carolina.

Mr. MINETA. Mr. Price.

Mr. PRICE. Thank you, Mr. Chairman.

I appreciate your testimony, Governor. I agree fully on the highway trust fund, the need to get those funds expended for their intended purpose. It is, I think, outrageous to use that fund to mask our deficit problems in other areas. I also appreciate your very effective emphasis on the question of fairness on North Carolina getting its share of these funds. Do you have any figures on how we fare in the formula funds versus the discretionary funds for highways? Do we have an equal problem in both areas?

Governor MARTIN. The chairman mentioned the 85 percent. Is that what you mean by the formula fund?

Mr. PRICE. Eighty-five percent, as I understand it, is to apply to both.

Governor MARTIN. Perhaps I can see if we have that. Excuse me. I will have to get that for you, Congressman. Just as I was looking around, everybody else was looking around. Secretary Harrelson was looking around.

Mr. PRICE. While they are conferring——

Governor MARTIN. But, what you want is to have for the record some information that would show the distribution of the total, but also the component parts, of the Federal highway fund?

Mr. PRICE. That is right, and——

Governor MARTIN. As it applies to North Carolina.

Mr. PRICE. And while we are on the subject——

Governor MARTIN. We will get you that.

Mr. PRICE. We clearly have a major problem with mass transit and just a very, very small return on our contribution there. I suppose the question one would ask about both the discretionary highway funds and the mass transit funds, are there ways the State, working with Federal administrators, could make more effective applications? Are there ways in which Federal law needs to be changed to enable us to do that? I mean, clearly, we are constrained by the terms of Federal mass transit aid, as Congressman Valentine stresses. That aid simply is not available to the sorts of purposes—for the sorts of purposes that we have in our cities and in our areas like the Triangle where the main need, perhaps, is for intercity mass transit.

Governor MARTIN. Yes, Congressman, and that is the reason that I brought it up. That we ought to address that and see if we cannot change it so that it would be more equitable. Our people have mass transit needs that are not defined in the same way as in some other areas. And that is why I would encourage you to negotiate with your colleagues ways to modify those definitions so that we can qualify more fairly. We are not a wealthy State. Again, I would emphasize that. We have been advancing in per capita income. We have come up from 44th, 8 years ago to 34th today. That is some progress.

But still, we are not among the wealthiest States; and yet, we are a donor State. And it is because all of the formulas—and the demonstration grants on top of that—all work against us. And so, I would hope that you could modify that so that we could use the creative ideas that many of our cities—including the ones in your district—are developing for better public transportation and help us to do that.

I would mention that insofar as working with the Federal administrators, we have had a good relationship with them over the years, regardless of administrations. We have had a good relationship with them and have been able to do fairly well with some discretionary funds; but, that counts against our minimum allocation, I believe, so it does not do us a whole lot of good as far as the percentage that we get back.

Mr. PRICE. Thank you.

Mr. MINETA. We use the word "transit" a great deal. Does that connote too much of an imbalance, maybe leaning toward the urban side, rather than rural? And maybe in order to get away from that, we should really go back to the Urban Mass Transportation Act of 1964 and talk about urban transportation and rural transportation in order to make sure we get that balance.

Governor MARTIN. Mr. Chairman, I think you are right. Even with the—you know—the selection of words. It is a perfectly good Latin word, transit, representing the movement from one position to another. But, it has taken on the connotation of a train transit, derived from the same word. But, that has sort of captured the thinking and the philosophy of mass transit. What we are talking about is public transportation for the people of an area so that they can get where they want to go with a minimum of congestion and

wasted time. We want to preserve those features of the life of our State.

Mr. MINETA. The survey seems to indicate that the people are willing to spend 50 percent more in terms of dollars or 30 percent more in terms of time and move from an automobile to public transportation if it is safe, reliable and efficient—and they are willing to pay up to 50 percent more in money and 30 percent more in terms of time, so that they can—if they could get out of their car, if there were another system available. Has North Carolina taken much advantage of the section 3 portion of the Urban Mass Transportation Act to allow that extension to move funds from the highway side to the mass transportation side?

Governor MARTIN. Mr. Chairman, as to the technical aspect of the section 3, which does not register in my consciousness, I would, of course——

Mr. MINETA. Sure. I will ask the same question of the Secretary.

Governor MARTIN. He will be prepared to respond to that. [Laughter.]

As you can imagine, Governors know almost everything; but sometimes, someone as wise as the chairman can pick a topic that I am not——

Mr. MINETA. Again, I just want to thank you very, very much, Governor, for your taking time from your own busy schedule to be with us today. This is an important subject for you personally, I know, and for North Carolina. And so, to have you here personally is even more indicative of your commitment to transportation. I would like to thank you very, very much.

Governor MARTIN. Thank you. Our responsibility is basically at the state level for better schools, better roads, better jobs, better environment, and we want to make progress on all of those, with your help.

Mr. MINETA. A lot of those jobs are leaving California to come right to North Carolina. Thank you very much.

Governor MARTIN. Thank you. We have got several of them upstairs.

Mr. MINETA. I bet. Yes, indeed.

I would like to again yield back to my colleague from North Carolina, Congressman Price.

Mr. PRICE. Thank you, Mr. Chairman. I would like to add my welcome to everyone attending this field hearing today. And thank you especially, Mr. Chairman, for taking the time to participate in this discussion about our country's surface transportation system and about our particular needs in North Carolina and the Southeast. I want to thank Tim Valentine and his staff for their work in bringing this field hearing to our area and for including me, although I am not a member of the Public Works Committee, in this hearing. I have the pleasure to serve with both Mr. Mineta and Mr. Valentine on the Science Committee. But I am an outsider in terms of the Public Works Committee, and I appreciate very much being included.

Research Triangle is an appropriate place to hold these hearings on surface transportation problems and solutions. We are a region in transition from being a cluster of small cities and rural townships into developing into a large—one large urban center. And, as

we encounter this transition, our State and local governments are looking at examples—both good and bad—set by other regions in the nation in deciding what type of transportation system will work best.

As a state, North Carolina is addressing the growing need for better access between our major urban areas, while also addressing the needs of our rural areas. We appreciate our Governor's testimony in this regard.

The good news is that we are planning ahead—that many good ideas are on the horizon. Amtrak, for example, recently began east-west service from Charlotte to Greensboro to Raleigh, with the aid of our State government. Interstate 40 is now complete from Wilmington to Asheville. Here in the Triangle, we are in the process of starting intercity bus services and are looking into the possibility of intercity light rail services.

The bad news is that the Federal Government is contributing less to infrastructure than at any other time in modern history. Since 1980, Federal grants and aids for infrastructure have shrunken by a whopping 40 percent. This comes at a time when our Nation's infrastructure needs are overwhelming. In the next 10 years, it is estimated that we will need something like $300 billion to repair our highways, another $50 billion to replace and rehabilitate our bridges. I believe the Federal Government should continue to play an important part in our Nation's surface transportation future. In addition, we need to better utilize the Federal transportation money that we have. We need to unlock the reserves in the highway trust fund and use this money for its intended purpose. We need a more equitable distribution of highway trust fund money comparable to a State's contribution. This is especially critical to North Carolina, as I know many witnesses today are going to underscore.

I appreciate the committee's continuing commitment to these matters and welcome you here today. I look forward to hearing the testimony of all of our witnesses. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Price. I was just looking at a map. I think it was not too long ago—maybe within the last several months ago—that we completed I-40 finally from North Carolina all the way to Barstow, California—that is right—with no stop signs in between—a complete—complete road system at that point.

Well, I want to thank everybody for their very warm welcome and hospitality to the Second Congressional District and to this area. This field hearing that the Surface Committee is having is really a continuation of a number of other hearings that we have had to try to determine the sum and substance of the future for our Federal aid highway system, as well as the mass transit program, safety programs that the Governor mentioned and research and development and other kinds of programs that are within the present law that will be expiring on September 30, 1991.

As all of you know, during the past 34 years, since the time President Eisenhower signed the Interstate Defense Highway System Act, Americans have enjoyed a tremendous Federal investment of more than $270 billion in our Nation's transportation systems—and that is both highways and in terms of mass transit as

well. Through that program, we have built roads and bridges, Interstate System and mass transit systems. We have built a way of life that has sustained the American people and fortified our economy. And the big question now is, what about tomorrow? Especially in high-growth States, like North Carolina where transportation plays such a key role. As I indicated earlier, I come from Silicon Valley in California. That is my district. And there are many similar facets of this area—the Research Triangle area—to our Silicon Valley in California.

For tomorrow, we must make certain that Americans can travel safely, that we move people and goods in a way that will improve our economic competitiveness internationally. Our companies and our economies have been able to grow because of the growth of our own and strength of our own domestic economy. But, that is no longer the case. We are now part of an international economic marketplace. And the question is, are we going to be able to compete in that international marketplace in the balance of the 1990's as we prepare for the 21st century?

The question of quality of life—what about the kind of air we breathe and the water we drink? The whole issue of quality of life is embodied in terms of what we are doing in this legislation, and we must leave no doubt in the minds of our children that we are going to act forthrightly, and more importantly, consistently.

Americans now travel more than 2 trillion miles on our highways each year. In the future, that level will only rise. And yet, it is estimated that as a nation, we will need to invest annually $95 billion a year just to retain the 1985 level of service through the year 2020. And so, the question is, where will we get the money and how should we use it? Clearly, the strong partnership that already exists among the American people, business, industry and all levels of government are going to have to be called upon to meet the challenges of building and rebuilding our transportation system. But at the same time, we must not lose sight of the fact that how we spend the money is just as important as how much money we have to spend.

So, for more than a year now, our Surface Transportation Subcommittee has set a legislative agenda to try and put together a set of hearings and a record to indicate the kind of system that we want to build in terms of the future—the future that America wants, and more importantly, needs. We have conducted these hearings in Washington, DC, where we have received expert testimony. But, the health and well-being of our transportation network requires more than these kinds of series of hearings in Washington, DC. It requires really the kind of hands-on experience that we intend to be hearing here in North Carolina. And, that is why we are here. We are here at the invitation of Congressman Tim Valentine to come and see what this part of the country is doing in order for us to formulate our programs for the future. I know how proud you are of Tim here in the Second Congressional District.

I have the good fortune of serving with Tim on the Public Works and Transportation Committee and also on the Science, Space, and Technology Committee, as Congressman Price has indicated. So, I have seen Tim's work since his election in 1982, his work on the Public Works and Transportation Committee and the Science,

Space, and Technology Committee since 1983. I have seen the work that he has done in terms of not only his work on highways and aviation, but really, in terms of all of the work that goes into representing the Second Congressional District. Tim has been able to bring in his gentlemanly way not only good humor, but a strong commitment in terms of looking out for the needs of North Carolina and the Second Congressional District, and I look to him for the leadership that he is going to have to provide as we try to bring this program together for the 21st century for this country.

In the 1960's and 1970's, we spent more than 2.3 percent of our annual gross national product on transportation. In the 1980's, that has now dropped to four-tenths of one percent. So to go from the 1960's and 1970's where we spent 2.3 percent of local, State and Federal assets in terms of transportation projects to now four-tenths of 1 percent, you can now understand, then, why we now have the congestion on our highways, deficient or functionally obsolete bridges, substandard pavement and decay of our mass transit systems. And the lesson is very clear. Transportation programs must never again be underfunded as they have been in the past.

In the 1990s, I believe the key role that we have to play is to find a solution to our Nation's transportation problems by attempting to define what is the appropriate Federal role. Now, I believe that that Federal role must take into account State and local needs and program flexibility. We have always worked on the basis of categorical assistance programs. But we have lost sight of the ability to be flexible among those categorical programs. And so, from my own experience of having been mayor of a city and having to deal with local categorical assistance programs and general revenue sharing, I was instrumental back in the 1972 and 1974 time period of heading up a committee both for the National League of Cities and the U.S. Conference of Mayors that finally ended up in 1974 with what we know today as community development block grants. So that kind of flexibility that we built into that program is something that I would like to see being put into place in terms of highways and transportation programs.

Now through this hearing, I am confident that we will further our efforts to determine what the Federal role should be in the future and to identify how we get there from where we are today. So let me again thank all of the witnesses today for their testimony and to thank especially Congressman Tim Valentine for his leadership and his hospitality in bringing us here to the Second Congressional District. I want to also thank Congressman Price for being here. Wade County and Chapel Hill and that area is also very important and is recognized by us in terms of what the needs are.

At this time, I would also like to submit for the record and ask for unanimous consent for Mr. Ballenger's statement to be submitted for the record.

At this time, I would like to call forward a panel made up of Commissioner Harold Rives of the Georgia Department of Transportation; Secretary Tommy Harrelson of the North Carolina Department of Transportation, accompanied by Dr. Larry Goode; and Harold W. Worrall, the Assistant Secretary for Finance and Administration for the Florida Department of Transportation. So, Mr.

Rives, Mr. Harrelson and Mr. Worrall, if you would please come forward, and Mr. Goode, I appreciate it.

Your prepared statements will all be submitted as part of the record. And so, in the interest of time, I would appreciate it if you would go ahead and abbreviate your testimony and proceed in your own fashion. And, I would like to call on first Commissioner Hal Rives of the Georgia Department of Transportation. Commissioner Rives.

TESTIMONIES OF HAL RIVES, COMMISSIONER, GEORGIA DEPARTMENT OF TRANSPORTATION, ATLANTA, GA; SECRETARY TOMMY HARRELSON, NORTH CAROLINA DEPARTMENT OF TRANSPORTATION, RALEIGH, NC; HAROLD W. WORRALL, P.E., SECRETARY FOR FINANCE AND ADMINISTRATION, FLORIDA DEPARTMENT OF TRANSPORTATION, TALLAHASSEE, FL

Mr. RIVES. Thank you, Mr. Chairman. It is good to be here, and thank you for giving us the opportunity to appear before you. You have my prepared Statement. I would like to concentrate my remarks on three phases of the reauthorization program, and that is funding, the character of the Highway System of National Significance and increased truck weight sizes, et cetera.

As a representative of the Georgia Department of Transportation, we support the AASHTO funding proposal for the Reauthorization Act. And that proposal is for highway funding beginning in fiscal year 1972, as well as transit funding for highway funding to rise to a level of $17.6 billion. In 1992, transit funding rising to $3.5 billion and proceeding upward on a graduated scale to 1995, where highway funding would be $25.9 billion and transit funding of $5 billion. We would note that through 1993, that can be accomplished by drawing down the balance on the trust fund, without any tax increase. In 1994, however, because the balances would be extended, there would have to be a significant increase in moneys flowing into the program in order to accomplish it. But, this is—this is vital and it is necessary.

In 1988, highway funding from all sources—federal, State and local—was $66 billion. The Federal portion of this was approximately $14 billion. Our AASHTO studies show that this needs to rise to $100 billion a year just to maintain the current level of service that is on the system to take care of the growth and maintain the current level of service. No improvement to the current level of service. It would take $80 billion per year nationally. To improve the current level of service, as well as meet the—as well as meet the growth, we need another $20 billion per year. That will not bring the level of service up to theoretical needs. We, in AASHTO, call this a constrained program that constrains the level of service somewhat below the theoretical needs, but would increase the level of service over what we have today.

The AASHTO proposal would increase the Federal share of this, which on the current $66 billion, was approximately 21.2 percent. On the AASHTO program, the Federal share of the total expenditure would rise to approximately 26 percent.

We think there need to be changes in the distribution of the funds. We think that a new formula should be developed that

would relate to the factors of highway use and the size of the total highway network. These factors would be vehicle miles traveled on the system, diesel fuel consumption and lane miles. The formula should be constructed by giving weights to these various factors, so as we turn to each State, a minimum of 92.5 percent of the motor fuel funds collected are the highway user taxes collected from that State.

The minimum—the minimum allocation program would, therefore, be eliminated, along with some of the bad portions of that program, which—if you are a minimum allocation State, as Georgia is—precludes you from receiving benefits through the various discretionary programs set up in the current act. That is a big factor.

We think that the highway system of the future—the one that will be reauthorized—should consist of two programs—a categorical program which would handle the Highway System of National Significance, and the flexible program, which would be flexible with moneys going into this program being eligible for use on any transportation program within the State—any highway and transit elements.

The Highway System of National Significance is a major facet of AASHTO's proposed reauthorization and of Federal highways. This Committee—your Committee—the total Committee requested that the Federal Highway Administration develop maps showing the proposed Highway System of National Significance. That came from the House Public Works and Transportation Committee.

The Federal Highways directed the States to prepare two maps and gave us the option of preparing a third. The first map they called—they stated would be the basic system, and they allocated nationally for that map 120,000 miles. This is much too small, particularly when you look at the way they apportioned it between the States. In Georgia, it would not even provide sufficient mileage for the defense necessary for Strahnet. When you take out the miles that would be on our Interstate System, we would receive fewer miles for the non-interstate portion than we have on the Interstate Highway System. It would not provide a system. This limitation on size would not provide a system in Georgia that would serve the defense needs, nor will it provide a reasonable system for intrastate travel, nor will it provide sufficient mileage to have reasonable connectivity to our adjacent States.

The second system that the Federal Highway said that we could submit—that they asked for—was an alternate system with 150,000 miles. That is somewhat better, but it is still inadequate. Federal Highway Administration seems to be looking at perhaps an extended Interstate System—an extended system of highways designed to interstate standards. Therefore, they are keeping it small. But, many of the miles on this system do need to be designed to interstate standards. The AASHTO standards that have been developed have been approved by Federal Highways for use on Federal aid work set standards for various classifications of roadways, depending upon the traffic. That should be used as a guide, while not determining—predetermining the design standard for a specific road within the system, but look at its service. Look at its traffic. Look at the service level. Then, use the AASHTO standards to decide the standards to which a specific road will be designed.

The third system that Federal Highways have given us the liberty to pursue we are doing in Georgia. We have submitted the maps to Federal Highways. A national system of about 180,000 miles, if property—if properly distributed to the States would suffice. The distribution currently used by Federal Highways is obviously at fault. As I understand how they distributed the mileage to the States was that they looked at the traffic on the current Interstate Highway System. They took the average of that traffic and allow you to put other roads on the system that have traffic higher than the average on the interstate. When you take a system like ours that has very high interstate traffic on it, then that precludes many of the rural miles that we are trying to put on the system that need to be put on the system.

In doing this, as I understand it, the request of committee was for Federal Highways to follow AASHTO criteria in establishing the Highway System of National Significance, and they certainly have not.

I will close my remarks with a few comments about trucks. There are proposals by the American Trucking Association to put triple-bottom trucks on the highways—triple 28½ bottom trailers—big trailers—and double 48-foot trailers on our highways. We are adamantly opposed to this. Not only will the load be heavier with respect to the structural capacity of our highway systems; but they will not meet the geometric constraints that are on our highway systems. They will be unsafe. Tests conducted in the State of California illustrated the weaving and the moving back and forth of those combinations on highways—of those combination of vehicles.

This will also cause something else that I do not think—we do not think it is in the public interest. That is a further shift of tonnage—of freight tonnage from the railroad onto the trucking industry. We think there is a balance—I do not know what it is—that should be kept between the rail system and the highway freight system. And, we think competition should dictate what that is. That competition should not be affected by legislative breaks to either one of the two competing systems.

Finally, safety with respect to trucks—we find in Georgia that if you have a highway that has 15 percent trucks, the trucks will be involved in 30 percent of the fatal accidents. Trucks double the percentage of volume of traffic with the percentage of fatal—their involvement in fatal accidents. That is an area in which our fatal accident rate is growing, should not be tolerated and should not be encouraged.

I thank you for hearing me.

Mr. MINETA. Thank you very much, Commissioner Rives, for your fine statement.

Secretary Harrelson.

[The prepared statement of Commissioner Rives appears on p. 3347.]

Mr. HARRELSON. Thank you, Mr. Chairman, for the opportunity to speak with you this morning. I want to thank the House Public Works Subcommittee on Surface Transportation for coming to this region of the United States. I am particularly pleased that you have come to North Carolina. And I want to thank you, Congressman Valentine, for your diligent work and for seeing to it that

highways, bridges and public transportation are put in the forefront. They certainly are issues we desperately need to deal with.

Today is just one way to start that process. Tackling the job of a new reauthorization bill will be no easy task. The budget deficit and the current Middle East crises will no doubt make your job more difficult. You will have to deal with individual groups, organizations and States coming to you seeking your help in making this new bill a fair one. We realize how important your role is because this transportation bill will lead not only us, but our children and even their children, into the 21st century.

What I want to do this morning is give you a North Carolina Department of Transportation perspective. We have been dealing with a situation I want you to know about. For 34 years, North Carolina has received the smallest proportion of Federal highway funds during the highway trust fund's history than any State in the Nation. For every dollar we contributed to the Federal highway trust fund since 1956, and including the year we are in right now, North Carolina has received 83 cents in return. But, that only represents part of the picture. When we include the interest that has accrued to the trust fund, which also is part of the apportionment process, our net return is a mere 73 cents on the dollar.

During the life of the trust fund program, our state has suffered an estimated $1,910 in lost revenue. That is almost $2 billion North Carolina has badly needed to meet the demands of a rapidly growing State. Two billion dollars that has been spread out across the Nation through formulas that became outdated decades ago.

These facts become even more significant when you realize that North Carolina historically has had one of the lowest per capita incomes in our Nation.

Out of necessity, North Carolina has responded by initiating an innovative State and local funding program to make up this Federal funding void. Our State gasoline tax is 21¾ cents per gallon, the fifth highest of all States. The tax supports virtually all highways in North Carolina, the largest State-supported system at 76,000 miles. We have a long-standing financial relationship with our communities that dates to 1951 when we began sharing State motor fuel tax revenues directly with our cities and our towns. I trust you will hear from some of these mayors today on the success of these relationships, as well as the initiatives within our own municipalities to develop local funding packages necessary to get the transportation job done.

And last year, North Carolina committed an additional $9.2 billion during the next 13-plus years to highway improvements and expansions. In large measure, our highway trust fund law was passed because of the inability of the current Federal programs to address our growth demands. We felt it necessary to "pick up the ball," so to speak. Local governments have also done the same, and several of our State cities and counties have passed major highway and transportation bond issues.

Even so, an appropriate Federal program remains critical to this partnership. The establishment of funding levels, categorical formula criteria and matching ratios must be developed independently of these individual State initiatives. No State that has initiated

major funding packages to address its own needs should be directly or indirectly penalized under a new program.

On a broader level, we support the concept of a Highway System of National Significance. However, we do not think it should be loaded up with smaller highways, simply to improve a State's position in return of Federal dollars. The system should be defined to include only those highways truly of national significance—those on the Interstate System, most principal arterials and limited others.

Also, we support the concept of two major spending programs—a categorical program for highways of national significance and a flexible program for all other highways. North Carolina seeks the most flexibility possible—within these programs and between them. We have numerous examples where categorical programs and the lack of flexibility have cost us money, delayed projects and worked against the needs of North Carolina. A good example is our bridge program.

We recognize the fact that the categorical program should be driven by formulas. At the same time, it is universally accepted that many of the existing factors driving today's formulas are outdated and no longer reflect the needs of a national transportation system. They do not reflect the use of the system, and they certainly do not reflect the high growth that many States have experienced in the last decades.

We know the redefinition of these factors will be difficult, but it is necessary. North Carolina largely supports formula factors based on the use of the highway system, rather than its size. We think use characteristics more accurately describe the wear and tear on the system and the need for capacity expansion. Factors such as vehicle miles traveled and motor fuel consumption more accurately measure the demand on the highway system than do land area, density population and the like.

U.S. DOT's cost allocation studies in 1982 found that about 70 percent of the wear and tear on the Nation's highway system was due to use. About 30 percent was a result of such factors as weather, exposure and old age—best measured by size characteristics. Consistent with these findings, we think use factors should be weighed more heavily than size factors in any new formula. This is consistent with the recommendations of the U.S. General Accounting Office.

We recognize the unique difficulties in many stages, particularly the extremely rural States that cannot generate the tax base necessary to construct and maintain their portion of nationally significant highways. Allowance for such situations must be made. We stand ready—as we have through AASHTO—to continue working toward ways to accommodate a system that is fair to all States coast to coast.

While we do that, however, we should not lose sight of the basic premise that highway use causes the damage that requires repair, causes the congestion that must be addressed and reflects the growth and access requirements that must be served.

Above all, we must work toward a new or modified national program that provides funding equity to the States. We realize that any taxing system creates "haves" and "have nots" and that a re-

distribution of some resources must occur. At the same time, fairness must be paramount. I will tell you today that North Carolina, a low-income State, along with a few other States, has carried the brunt of the funding for the national program since its inception in 1956.

While we are talking on the subject of fairness, let us revisit a bit the public transportation funding. North Carolina sends, as you already hear, $40 million a year to Washington and only receives $2 million in return from the mass transit account. This is a 5-percent return on investment—certainly, the worst of any State in the Nation. This—as I am sure you will agree—is an erosion of our transportation funding base and an inequity for which correction is long overdue.

What we want in North Carolina from this new legislation is equity and flexibility. Equity means a fair return from the Federal program. Flexibility means the ability to put the funds to work where the needs are in North Carolina. We will do that in a responsible and environmentally conscious and timely manner. We have a proven track record of responsibility and fairness that is evidenced by the relationships we have with our General Assembly, our cities and our towns and our rural areas.

The future can really be exciting for us, but there is much work left to do. You will have many issues and perspectives before you. We look forward to working with you as together we face the transportation challenges ahead.

Let me tell you again how delighted we are to have you in North Carolina, how excited we are and appreciative of your holding this hearing in the southeast. Thank you again.

Mr. MINETA. Thank you very much, Mr. Secretary, for your very fine and complete statement.

I would now like to call on Harold W. Worrall, the Assistant Secretary of Transportation for Finance and Administration for the Florida Department of Transportation.

Mr. Worrall.

[The prepared statement of Secretary Harrelson appears on p. 3271.]

Mr. WORRALL. Thank you, Mr. Chairman, Congressmen. I want to take this opportunity to thank you again, as some of the other States have, for having this hearing in the southeast, for we at the board of DOT hope that today's hearing will serve as a vital step towards achieving some of the goals that are expected in the reauthorization of the Surface Transportation Act.

The Federal aid surface transportation program, one of the most important programs in the Nation, has a profound effect upon life in America. Today, American transportation stands at a crossroads. As international events have demonstrated over the past year, the world is changing dramatically, and the United States must change with it. Soon, your committee will be framing the most important transportation legislation in nearly 40 years. Significant change in Federal funding formulas and program structures must be brought about, and reauthorization provides the vehicle for this vital change.

Before I begin some of the other testimony, I would like to present some statistics on Florida. We have approximately 13 mil-

lion residents in Florida. That is a 30-percent population growth from 1980 to 1990. We have 37 million visitors a year in Florida. Twelve autos for every 10 residents in Florida. Six of the top 10 growth areas in the Nation are within the boundaries of Florida. We have had a 60-percent increase in traffic in Florida from 1980 to 1990. And, we are now the third largest contributor to the Federal highway trust fund, $689 million in 1990.

Florida has documented many of its recommendations for some of the proposed changes in a brief report entitled, "Transportation 2020: Ideas for the 21st Century . . . Florida's Future Depends On It." This report, which accompanies my testimony today, makes three recommendations and then provides a rational justification for each of those. These three recommendations are of such fundamental importance to the improvement of American transportation that they could quite appropriately be referred to as the "Three R's of Transportation." Instead of the traditional grade school "Reading, 'Riting and 'Rithmetic," these three "R's" are "Raise, Restructure and Revise."

First, raise transportation funding over a period of years by reducing the balance in the Federal highway trust fund.

Second, restructure the overall Federal transportation partnership to use more efficiently whatever level of funding is made available. We believe that 60 or more current Federal funding categories should be consolidated into a focused simplified program.

Third, revise the current formulas which disburse transportation funds to the states to more accurately reflect today's transportation needs. Because allocation formulas direct the distribution of transportation money, they are the key to the entire program. Therefore, we support the AASHTO's recommendations for revised Federal funding formulas. Florida, along with several other States, have also advanced the AASHTO process one step further by advocating a specific allocation formula. The short white paper entitled, "Federal Highway Financing, Who Gets What," also included with my testimony, provides further explanation of this recommendation.

While we do not claim to have arrived at the perfect allocation formula, our formula does provide a rational and equitable method for distributing Federal highway trust fund dollars. However, like beauty, equity is often found in the eye of the beholder. The subcommittee may wish to review the projected levels of the minimum allocation fund in any of the proposed allocation formulas yet advanced in order to arrive at a less subjective definition of equity.

Originally created in the 1982 Surface Transportation Act, the minimum allocation supplement now includes some 19 States at an annual cost of approximately $1 billion. The size of the minimum allocation program is a clear indicator of the current programs in equity. Consequently, we believe that those proposed formulas should reduce the number of MA States, and the total cost of the MA supplement should be logically viewed as being more equitable.

Although formulas proposed by some Western States would, indeed, cut the number of MA States about in half and reduce the cost to the $300 to $500 million range, our formula would leave only two MA States with a cost of less than one-half million dollars. Such a formula should clearly be considered equitable.

Having paid $689 million into the highway trust fund in fiscal year 1989 and only receiving back $355 million in fiscal year 1990—a return of just 52 cents for every dollar sent to the trust fund—we firmly believe it is time for a program that addresses the needs for all States by providing a fair return on our contributions. The time has passed when Florida can accept a program which benefits a few at the expense of the many.

Let us design a new Federal aid program to match the exciting challenges of the 21st century. If we are to meet the needs of tomorrow, we need the same kind of boldness present in 1956 when the Interstate System began. A band-aid approach of patching up the current program is not capable of carrying us into the next century.

We at the Florida DOT solicit your support for the recommendations contained in our testimony and the accompanying materials. We look forward to actively working with you and your staff to enact these important proposals into law.

Thank you again very much for the opportunity to present our testimony here today.

[The prepared statement of Mr. Worrall appears on p. 3380.]

[Additional materials appear on pp. 3384, 3392.]

Mr. MINETA. Thank you very much, Mr. Worrall, for your complete statement.

Mr. Rives, you speak of the need to revise the formula factors which determine the allocation of Federal highway funds in favor of those which might better reflect the transportation needs of the States. Are you confident that such factors as VMT—vehicle miles traveled—can be inexpensively, yet accurately, measured by the States, and if so, could you describe Georgia's efforts in this area.

Mr. RIVES. Yes, I do. I think that the highway performance monitoring system, which is a—uses, I believe, in Georgia some 1,200 monitoring points that are statistically set to model the highway system with respect to the character of the road, the character of the traffic and the volume of traffic that flows on it. It is through those counting stations and the other things that they do there, we have a good statistical model of what is going on in our highway system and we can accurately measure the VMT.

Mr. MINETA. The problem of—you know—what to use as a basis becomes such a contentious issue because I guess as you go further west, lane miles becomes much more of a factor than VMT.

Mr. RIVES. I would put lane miles—my formula—the three factors in my formula would be VMT, diesel fuel consumption to get the truck factor into it—we are a high truck volume State—and lane miles simply to reflect the cost or the means of maintaining physically the structure—the physical structures that you have on the road. And those three factors—maybe not necessarily weighed evenly within the formula—but those three factors would most adequately reflect the factors that need to go into a distribution formula. I think perhaps there should be different weights on each one of those factors so as to get a realistic return of dollars collected back to the States that are involved.

Mr. MINETA. Secretary Harrelson, in your testimony, you are critical of the amount of funding that North Carolina receives from the mass transit account of the highway trust fund. The one penny

that goes into the motor fuel taxes that are earmarked for transit purposes of the 9 cents that is the Federal gasoline tax. How would you respond to someone who suggests that not all Federal transportation programs can benefit each state equally just as other programs, such as those provide agricultural type support, et cetera, do not benefit each of the states equally?

Mr. HARRELSON. Mr. Chairman, we feel that we need to be benefited from this program equally because the needs of the rural poor are not being adequately met, nor are the needs of medium-sized cities being adequately met by the inequity in the way this money is distributed nationally. We think that transit needs are all over the country, regardless of whether you are in a major urban area, or whether you are in a rural area.

Mr. MINETA. And, has North Carolina applied for discretionary section 3 funds to extend to the transit side?

Mr. HARRELSON. Mr. Chairman, we are a very aggressive department, and we try every angle we can to look out for our interests, and we have applied for those funds and gotten all we—all we—we have been pretty well treated on that. But, the basic formulas do not—just work so hard against us that no matter how hard we try discretionary funding, we just cannot come up to anything close to fairness.

Mr. MINETA. In looking at the new national transportation strategy or policy that has been issued by President Bush, how do you think you would fare under that program in terms of how they are restructuring it, hoping that States would come up with more monies to fund local programs?

Mr. HARRELSON. We would fare exceptionally well under that because we have already taken the initiative as a State to provide for greater funding for transportation at the local level, and we have already done that. And if that did come about, we would—we really would not have to do anything further.

Mr. MINETA. Okay.

Mr. Worrall, under Florida's three R's of transportation, the first R provides for raising transportation funding to nearly $18 billion in fiscal year 1992, and then gradually to $26 billion in 1995 by drawing down the balances from the highway trust fund. If the Congress authorizes funding levels of, let us say, somewhere between $18 to $26 billion over the next 4 to 5 years for the Federal air highway program, do you have any idea as to how much of a tax increase would be required in 1995?

Mr. WORRALL. At the Federal level?

Mr. MINETA. At the Federal level on the draw—on the completion of that drawdown that you have suggested.

Mr. WORRALL. I certainly have not calculated that out, but I can—it is my understanding that approximately a penny at the Federal level produces about $1 billion a year in revenue. I would expect that with the current balances in the Federal trust fund, you could probably make it out 3 to 4 years, as we have proposed in this presentation today. And then, at that point, there would be some significant increase at the Federal level, but I have not calculated that out, Mr. Chairman.

Mr. MINETA. The other thing I was going to ask about—as I recall in your statement, you talked about one of the R's as being a

consolidation of the program. If we are talking about this restructuring in terms of consolidating some of the funding categories into more focused and greatly simplified programs, would such a proposal provide assurances for funding these existing categorical programs? Would you have some sort of a grandfather clause—some kind of hold harmless—some kind of whatever?

Mr. WORRALL. It would be our expectation that any of the existing programs would have to be transitioned out. That it could not just be a cutoff and conversion to a categorical program. So, we would expect some sort of transition in that.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. Harrelson, the—when the Chairman asked you about—I understood—what I understood to be these discretionary programs and you replied that the department is aggressive in pursuing that sort of thing, are you talking about funding that is available to your department from the Federal Government that is in addition to this formula that we have discussed here? That is based maybe on special need?

Mr. HARRELSON. With respect to the highway discretionary funding, we have been aggressive, and in fact, were able to get discretionary funding for the Winston-Salem Bypass. But then, it counted against us the next year in minimum allocation. So——

Mr. VALENTINE. Well then, it was not—it was not discretionary funding, was it?

Mr. HARRELSON. It was an advance we had to pay back.

Mr. VALENTINE. Is that a matter of somebody's judgment in Washington, or is that written in the regulations, so far as you know?

Mr. HARRELSON. It is in the law, as I understand it.

Mr. VALENTINE. Well then, how do demonstration projects figures in this sort of thing?

Mr. HARRELSON. Demonstration projects are treated more equal than that—treated differently from that.

Mr. VALENTINE. Well, are you saying that we treat everybody equally, but some more equal than others?

Mr. HARRELSON. As the book said, some are more equal than others.

Mr. VALENTINE. And a demonstration project, by the very nature of the beast is a little something extra, is not it?

Mr. HARRELSON. Yes, it is, and it demonstrates the ability of somebody to get the project funded; but it does not necessarily demonstrate the need——

Mr. VALENTINE. What I am really trying to get at—could not we—in this State, with all the effort that has been forth to change the situation that exists and has existed for many years, that we could very well be in a situation where we are hooked into—or have been hooked into a formula that we think is unfair. And yet, when we go to the Federal Government to ask for discretionary funds—we ask for a little extra help because we need it—that they can now say, "Well, you do not need it because you got all that money you raised down there yourself." So, by becoming involved in—by what we think of as being forced to be involved in an ambitious, far-reaching program to increase the tax on our own citi-

zens—make it one of the highest in the country. Spend—what—$9 billion over the next 13 years or so. In your opinion, could that initiative of itself, under the present arrangement, come back to haunt us?

Mr. HARRELSON. We would urge the subcommittee and the committee to not penalize North Carolina for being proactive. We should be, if anything, rewarded for taking a stand. We should not—certainly not be——

Mr. VALENTINE. Well, do we not need to talk about not so much to what the Congress can do—and I agree with you—but, what the bureaucracy can do or ought to be able to do now.

Mr. HARRELSON. I think that because of the law, that the bureaucracy's hands are tied as to any help they can give us.

Mr. VALENTINE. What—do the—well, I guess I have asked you that. But, I will ask again for the record. Do the figures that you have given us here that have to do with our percentage participation and what funds are available—do those figures take into account any other methods of funding—discretionary funding, demonstration projects or any emergency money or anything else that comes into the State?

Mr. HARRELSON. That is total funding. That includes everything.

Mr. VALENTINE. Tell us a little bit—so that we may increase in knowledge and wisdom—about the difference in the North Carolina highway system than many States. North Carolina runs the whole system in the counties, is not that correct?

Mr. HARRELSON. Yes, sir.

Mr. VALENTINE. In many States, the counties build roads. Tell our chairman something about that situation.

Mr. HARRELSON. Congressman Valentine is exactly right. We do—although we are not the biggest State, we have the biggest State system in the country. Other States have more roads, but we support as a State a bigger system than any other State—76,000 miles, including all of the secondary roads of the State. Now there are municipalities which have responsibility for some of their municipal streets, but we do—we are unique in that. There are other States, I suppose, that have State systems, but we have the most miles.

Mr. VALENTINE. What you are saying some States might have roads built by the county government. North Carolina builds all of the roads outside of the cities and towns, is not that right?

Mr. HARRELSON. That is correct, sir.

Mr. VALENTINE. And part of the money in the cities and towns is built by the State because of this power fund money?

Mr. HARRELSON. Yes, sir; built and maintained.

Mr. VALENTINE. Are we the only State that deals with it that way?

Mr. HARRELSON. I do not think so. I think that there are other States that have State systems; but, we are the largest of the State systems.

Mr. VALENTINE. Is there communication between your department and these other States? Because, you know, sometimes, I think that one might think, "Well, if we are the only one that is doing it, there must be something wrong with it." Or, "If there are only two of us doing it, there must be something wrong with it."

Do you talk to these other people and say, "How are you guys getting along with—how does it work the way you do it?" You know, to consider whether we need to change and put some of this burden that is on State taxpayers back on the counties, except for the counties in my district. [Laughter.]

Mr. HARRELSON. I think you have answered your own question, Congressman.

Mr. VALENTINE. No; but I mean, do you talk to them through your organizational ties?

Mr. HARRELSON. Yes, we do. We are very active in all professional organizations throughout the State—throughout the United States, and we do—we are very active.

Mr. VALENTINE. You know, we—I think that that is important to always see what other folks are doing. For years and years, North Carolina and one other State painted the school buses a little different shade of yellow. And, we still put signs outside of every municipality of North Carolina—the city limits, whether it is a city or town. You know, just some other—we pride ourselves on—sometimes, on these differences, and maybe sometimes, we ought to look around at what others are doing and see if it is time for us to change.

One thing it brings to mind is the toll roads. Many States have long ago gone to a system where they put the burden of the construction of bridges on the people that use the bridges. North Carolina has not had a toll road now for 60 or 70 years. What do you think about that? Do you give consideration? Would it be a good idea? Would it not be a good idea for us to save some of the money that we get from our taxpayers and the Federal Government and build the bridges that are needed over these inlets in eastern North Carolina that are going to be used almost entirely by local people? Would not it be a good idea for us to put some toll bridges down there?

Mr. HARRELSON. Congressman, we are looking into that. The legislation of setting up the trust fund also asks for—mandated that the Department report back to the General Assembly on the possibility of toll roads and, indeed, identify some specific instances where they might be available. We think there are some which possibly could be appropriate. You correctly pointed out bridges and some of the bypasses might be.

Mr. VALENTINE. I think that the resistance expressed by some big newspapers in the State maybe has caused some of we politicians to fear that. I think that that should be pursued aggressively. I think that there are many places where people would pay for the facility if they could get it and pay for it by tolls. And there again, I would—we would be one of—they have toll roads in Virginia and South Carolina. Would we not be one of only one or two or three States that has no toll facilities whatever?

Mr. HARRELSON. There is probably several that do not have tolls.

Mr. VALENTINE. By George, if we had been able to do something like they did in Virginia and get that bottleneck at the Richmond-Petersburg Turnpike, which must be the most lucrative toll road in the free world. [Laughter.]

Mr. HARRELSON. Hands down.

Mr. VALENTINE. They could finance the whole system with that operation. It has now gone to a dollar and a half. They raised it. It is not going down; it is going up.

What about—what do you think about radar detectors? What is the policy, or do you have any policy? What do you think about this business of people being able to manufacture and advertise and sell a device, the only purpose of which is to help people violate the law?

Mr. HARRELSON. I know some States have outlawed them. Our State has not outlawed them at this point.

Mr. VALENTINE. Do you think we should?

Mr. HARRELSON. It is possible that that would be a possibility that—for highway safety to cut down on speed.

Mr. VALENTINE. Why would not it—how could there be any other—any other answer to it? I mean, I do not want to cross-examine you. But I mean, when you got something that the only purpose in the world is to see to it that you find out where the radar is so that you can slow down—I mean, why would not that help us all just to be rid and finished with that? Would it help if the Federal Government forced you to do it? [Laughter.]

Mr. HARRELSON. It might.

Mr. VALENTINE. I used the term "help" loosely. Well, I do not want to take up a lot of—I am—really, I am trying to dramatize some things that I think in these areas—some of the things that I think we can do for ourselves in this—in our beloved State.

One final question, what do you think about these triple trailers or do you have any—is that what you call them? Do you have anything that you want to tell us about that? I see them advertised. As one who travels—who goes to his place of employment in Washington most of the time up and down Interstate 95, I do not know what—I cannot hardly imagine life on that highway with these rubberized trains moving up and down out there.

Mr. HARRELSON. Congressman, it might be appropriate if the third section was a caboose.

Mr. VALENTINE. We have got a big trucking industry in North Carolina. Do you all really have a position on that?

Mr. HARRELSON. We have not taken a position. My inclination would be that—it would not be appropriate for North Carolina.

Mr. VALENTINE. And, there is no—there is just no way that could be good for the highways, for public safety—is it? Is there any plus you can think of?

Mr. HARRELSON. It would not be—I—it would, of course, help in the trucking industries. It would help their efficiency. But, in the—I think the perception of the driving public would be very much against triple trailers in North Carolina.

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. MINETA. Congressman Price.

Mr. PRICE. Thank you, Mr. Chairman.

Mr. Harrelson, I would like to pick up on your comment about the bureaucracy's hands being tied. I fully appreciate the changes that are needed in the law—in the formula. I think we are all aware of that. But, I wonder if the administrator's hands are completely tied. My understanding is that this 85 percent is a floor, not a ceiling. And by definition, a good many States are getting more

than that. They have to be. Is there—is there no discretion at all that would enable us to do better?

Mr. HARRELSON. It is my understanding that the formulas, as set forth in the law, work so much against this State that we are unable to do better than that. The minimum allocation was—came forth later to—the inequities were even worse before that.

Mr. PRICE. I understand that. There have been some changes in the law that have helped somewhat. But now, there is that pot of discretionary money that exists in addition and that States are free to apply for and that we have had some success with in Winston-Salem, as you said.

Mr. HARRELSON. Yes, sir, Mr. Price, but then, we have to pay it back. It is—the minimum allocation States have to pay it back, which is even more unfair because we are getting less money to begin with, and we have to pay—we have—it comes out of our next year's minimum allocation.

Mr. PRICE. And that—how does that—how does that interact with the—with the 85 percent rule? That is what I am getting at. How does that minimum allocation work in conjunction with the 85-percent rule?

Mr. HARRELSON. It just offsets it dollar for dollar. It really becomes—it really is more of a loan than it is a grant. If you get a discretionary project funded, if you are a minimum allocation State, the next year, it comes out of your minimum allocation that same amount, dollar for dollar.

Mr. PRICE. So, the 85 percent really is not all it appears to be?

Mr. HARRELSON. Well, we get the 85 percent. But if you get a discretionary project, it is not adding to it.

Mr. PRICE. It serves, in this case, as a ceiling, you are saying?

Mr. HARRELSON. Yes.

Mr. PRICE. Not as a floor.

Mr. HARRELSON. It is a ceiling.

Mr. PRICE. Do any of the other States want to contribute to this discussion? Is that the way it functions in your case? Yes, sir.

Mr. RIVES. The 1986 act, in the last days of the 1986 act, Senator Bentsen from Texas put in an amendment that stated that if you received the 85 percent minimum allocation if you were a minimum allocation State, that if you received any other funds over and above that 85 percent in any one year, the next year, the minimum allocation would be discounted by the amount you had received the previous year over and above the minimum allocation.

So what Secretary Harrelson says is true. It happened to Georgia. We had two demonstration projects. We were very happy and congratulating ourselves until Senator Bentsen put in that amendment.

Mr. PRICE. Let me clarify. We are talking now not just about the discretionary projects, but also the demonstration projects?

Mr. RIVES. The same way with discretionary or demonstration—either one. Any way you get any money over and above the minimum allocation in this year, you pay back the next year.

Mr. PRICE. Well now, the demonstration projects, I thought, were a separate—I thought there was earlier testimony that they were separate, is that not true?

Mr. RIVES. They are separate from discretionary money, but you still pay it back the next year if you get any demo project money this year. It happened to us.

Mr. PRICE. If you are a minimum allocation (MA) State?

Mr. RIVES. If you are a minimum allocation.

Mr. PRICE. If you are not, then the demonstration projects are not under that——

Mr. RIVES. And discretionary both—you know, if you have got—if you have—I would rather have 85.1 percent—I am sorry—I would rather get 84.9 percent—I would rather not be an MA State, to tell you the truth. [Laughter.]

And be able to fight for those projects.

Mr. PRICE. Yes; I understand.

Mr. MINETA. If the gentleman would yield on this one point.

Mr. PRICE. Yes.

Mr. MINETA. The demonstration programs that are funded from the general fund are not treated as the demonstration programs, let us say, that are coming out of highway trust funds.

Mr. RIVES. It is only title 23, yes sir.

Mr. MINETA. Those that are funded out of the highway trust fund would then affect your next year's allocation.

Mr. RIVES. Yes, sir.

Mr. MINETA. But, if they come out of the general fund, that is not counted as a part of it?

Mr. RIVES. They are difficult to get.

Mr. PRICE. I know our time is limited. Let me move on. Just very quickly, Secretary Harrelson——

Mr. WORRALL. Congressman, if I may.

Mr. PRICE. Yes; of course.

Mr. WORRALL. I would just simply like to echo the same for Florida. We have had that very same thing happen to us. We had discretionary funding for the interstate to complete the interstate, and then subsequently, we had the reduction of the MA, so——

Mr. PRICE. Thank you.

Secretary, I could not agree more with that sentence in your statement about the importance of not penalizing States that have moved to help themselves. That is terribly important to us in North Carolina. Do you have some way you could elaborate that or some specific suggestions as to how we could make certain that that penalty is not imposed on States that have moved, after all, to tax themselves to help themselves to take the initiative?

Mr. HARRELSON. I would just suggest that to be on the lookout for any amendments or any language that would contain that proviso. We certainly would not want to be penalized.

Mr. PRICE. If anything, it ought to be a reward.

Mr. HARRELSON. If anything, a reward—exactly.

Mr. PRICE. Mass transit—the inequity there is almost incredible in terms of the amount of money that comes back to North Carolina compared to what we put in—something like a nickel on the dollar. Now, we have a lot of mass transit needs in this State. Maybe they do not fit the conventional formula—clearly, they do not fit the conventional formula. What changes would be required to do better—to get the help we might need in the future, for example, with intercity bus or rail systems here in the Triangle. We

can see those needs coming. What is it going to take administratively, legislatively to make ourselves eligible for that kind of assistance?

Mr. HARRELSON. Well, the two buzzwords we are using are "equity" and "flexibility." If we would get a fair return on the dollars we send in and we, as a State, are allowed the flexibility to use those dollars within the State the way we see fit to meet the needs of our citizens, then we feel like we can meet those needs in a better way than we are doing today.

Mr. PRICE. And those needs, as far as you are concerned, do include the kind of intercity——

Mr. HARRELSON. Yes, sir.

Mr. PRICE [continuing]. Pressures we are seeing here in the Triangle?

Mr. HARRELSON. Of course.

Mr. PRICE. Bus and rail?

Mr. HARRELSON. Bus and rail.

Mr. PRICE. Well, I know I would appreciate seeing a summary of the kinds of changes and criteria that would be needed in order to make those mass transit funds usable to us in these circumstances.

Mr. HARRELSON. We will certainly furnish you that information.

Mr. PRICE. Mr. Chairman, I would like to suggest that that be included in the hearing record. Thank you, Mr. Chairman.

Mr. MINETA. Without objection, so ordered.

Mr. Secretary, there was mention made about highways of national significance. Has North Carolina started the process of trying to determine what would be included in their system of Highways of National Significance?

Mr. HARRELSON. Yes sir, we have. We have started the process.

Mr. MINETA. Have you already completed that process?

Mr. HARRELSON. It is complete.

Mr. MINETA. It has been.

Mr. Rives, let me ask—in your testimony, you refer to the need for flexibility in meeting your future transportation mobility needs, and I wonder if you would share with us how would you define that flexibility and apply this term specifically to future surface transportation programs.

Mr. RIVES. That is part of AASHTO—the second phase of the AASHTO recommendations is the flexible program which would incorporate within it those programs not included in the HSNS. This would be the—currently, the Federal aid secondary program, the Federal aid urban program, the safety programs. And we would use that—we would use that money to continue essentially those programs, but be able to distribute that money without the categorical restrictions that currently you have between Federal aid secondary which is the rural program, the urban program which we really need more money in than we now have because as you compare the Federal aid urban program to the urban assistance program to the secondary program, we think the secondary program—more—we would like more money from the secondary program going to the urban program. With the flexibility that we would get under the AASHTO proposal, we could do that. In other States where they have more rural needs than they do urban needs, they

can move the monies back into—they can concentrate the moneys in the rural area.

It is hard to define categorical limits that fits all of our diverse 50 States, and that is why we need that more flexibility. We, with a very major urban area, the Atlanta area and other smaller urban areas, Savannah, Macon, Columbus, Augusta, Albany, Rome—we need to concentrate more money into the urban areas than we do the rural areas. Other States, Utah, Montana, they have just the reverse. That is why we propose that all other programs, except the Highway System of National Significance be put into a flexible fund by which we can address the unique needs for each unique State.

Mr. MINETA. So, you would have that flexibility going either way?

Mr. RIVES. Yes sir, going either way.

Mr. MINETA. I get the feeling, however, from "the highway interests," that they may be afraid that more of the money may go over to the transit side, and thereby reduce that portion. Do you have any——

Mr. RIVES. I think that would be up to the individual State to do that and up to the individual metropolitan area, when you get right down to it, how that would float. I think that in a flexible program, that we would want to have the ability to move money from highways to transit and perhaps vice versa. Right now, you can do that. Urban systems moneys—highway urban systems money can be spent in the urban areas on transit. It is up—that is a flexibility we now have, and that can still be done. That can be done today, and we would want to retain that. I do not see that within urban areas, the movement of urban funds to transit and vice versa would be affected by this because you can do that today.

What would be affected perhaps would be the movement of funds that now go to rural areas if they go into the flexible program could possibly then be moved into transit in your urban areas. Whether you would or not, of course, depends on the unique circumstances within the State or within the communities. And the programs are meant to serve them, so why not let them have that flexibility and the discretion of the authority within that State that better serve their populous.

Mr. MINETA. Mr. Commissioner, you have been commissioner for the State of Georgia how long now?

Mr. RIVES. I have been commissioner for almost 4 years, but I have been very involved for 33 years.

Mr. MINETA. Thirty-three years in the department?

Mr. RIVES. Yes, sir.

Mr. MINETA. Well, I have watched you and listened to you for a long period of time now. I just want to congratulate you on your activities within AASHTO and the leadership that you have been providing.

Mr. RIVES. Thank you, sir.

Mr. MINETA. Let us see, do you become President AASHTO next year?

Mr. RIVES. Unless my colleague gets too mad at me, I will be president in December.

Mr. MINETA. So, that is how you are going to get all of us to visit Atlanta in 1996 for the Olympics, is it?

Mr. RIVES. Well, if we——

Mr. MINETA. Or did I raise an open subject for you? [Laughter.] Did I open the door for you?

Mr. RIVES. I was going to say, depending on the character of the reauthorization bill, we invite you. [Laughter.]

Mr. MINETA. Well, let me thank this very, very fine panel with all of you who are leaders at the State level on transportation issues, and I do look to AASHTO very much and the National Governors' Association, the National Governors' Safety Transportation representatives. I look to all of you for answers to this. As many of you know, I chaired the Aviation Subcommittee for 8 years. And, my undertaking this task as chair of the Surface Transportation Subcommittee has only been since February 1989, so I am learning a lot from the likes of all of you. So, thank you again for being before us today. I appreciate it.

Mr. RIVES. Thank you, sir.

Mr. MINETA. At this time, we call forward the Honorable Bill Goldston, State senator and chair of the North Carolina Senate Transportation Committee. Senator, it is great to have you with us. Is Senator Basnight with you, sir?

Senator GOLDSTON. He did not make it.

Mr. MINETA. He did not. Okay.

Senator Goldston, if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF HON. BILL GOLDSTON, SENATOR, NORTH CAROLINA GENERAL ASSEMBLY

Senator GOLDSTON. Thank you, Mr. Chairman, and I would like to welcome you to North Carolina, and having worked in your fair State for 7 years, I cannot think of anyone more qualified to——

Mr. MINETA. I am sorry to have lost you to North Carolina. Whereabouts were you?

Senator GOLDSTON. I am from North Carolina, but was just transplanted for 7 years.

Mr. MINETA. Whereabouts were you?

Senator GOLDSTON. Down in Irvine, California.

Mr. MINETA. Irvine—a beautiful area.

Senator GOLDSTON. But I happened to see your transportation problems, and I cannot think of anyone any more qualified to chair this panel.

Mr. MINETA. So, that is why you also came back to North Carolina?

Senator GOLDSTON. And to our local Congressmen, welcome home. We are always delighted to see you.

I am W.D. Goldston, chairman of the North Carolina Senate Transportation Committee. Recently, I served as cochairman of the bipartisan Highway Study Commission consisting of legislators, mayors, business leaders, and county officials to study our transportation needs, much as you are doing from a national level.

The study commission found that North Carolina, in fact, was growing. At that time, our 1990 population is estimated to be over

6.6 million people, a 12-percent increase from the 1980 total. The demographer went on to project that the population would increase another 10 percent by 1990, and the year 2000 would exceed 7.2 million. This growing population caused us to look ahead—try to look ahead at transportation needs.

If you extrapolate these figures looking at vehicle registrations, in 1970, we had 0.49 vehicles per every—per population—per person in North Carolina—man, women and children. In 1980, that moved to 0.66. In 1990, it is now up to 0.82. And if we move this on out to the year 2000, it would indicate that we will have 1.04 cars per person in North Carolina, which puts a tremendous strain on our roads.

Unfortunately, our investment has not been keeping up with our needs. In 1988, our department of transportation estimated we had over $10 billion in needs. The future's needs that were accumulating at a rate of approximately $550 million per year, but included only those projects that were needed immediately at the time to relieve urban congestion and provide additional capacity for overburdened rural roads. And when we put all these together, it was a staggering figure of over $16 billion in needs by the year 2000.

Our highway construction fund, I am afraid we have seriously neglected. From State funds, we have only put in about $60 million a year. So, you can see, we are going to be very short.

Now, as a study of our hearings that we held for 18 months, we came up with a $8.6 billion figure, which was recommended to the General Assembly to be funded over 12 years. Now, the General Assembly modified that to $9.2 billion over 13½ years, but kept intact the four basic goals—or five goals—that the study commission had established.

Now, let me talk just for a second about these goals. Number one was to construct 1,700 miles of new four-lane highways and widen and improve 113 miles of existing interstate highways on the 3,600-mile Intrastate System. We, too, believe in economic development and trying to get that economic development to our rural areas.

Now, had this road been in place—some of these roads down east—let me bring up an issue now that would have helped us tremendously with our Middle East crisis. As you know, we have Fort Bragg, Camp Lejeune, Cherry Point. If we had had these four-lanes, it would have certainly expedited moving these military vehicles to our ports at Morehead City and Wilmington in a much more expeditious manner than what we now have. Now, that is the first part of our plan.

Number two, to try to serve—help everyone to complete portions of urban loops around seven of our major cities to help relieve their congestion. There again, we are struggling with the same problem you are struggling with—how to help everybody.

So we then put in there to pave 10,000 miles of our unpaved secondary roads to help our farmers and people who live in our rural areas.

We also—Congressman Valentine mentioned a Powell bill fund—we also put an increase in there to help supplement the Powell bill funds to help our municipalities for maintenance of their roads.

Now, the fifth issue that we have discussed—that we have put in here—we allocated $5 million a year to provide funds to study a

mass transit system. To see if it is needed and possibly to help. Some of these funds, I am sure, Congressman Price, will be used to help this study that is going on now with the Chapel Hill/Durham/Raleigh area.

Now, this was a major initiative on our part. But, North Carolina has been known to take leadership back when Cameron Morrison—when he started the road programs, then to Governor Scott—we have always taken initiative. And, I think it is our—as leaders in the community—it is our initiative. We should do the same thing.

Now that I have spent my time bragging about North Carolina—which I think we should, to tell you you are not just sitting here waiting on the big eagle to come over and lay more money on us—we wanted to help ourselves. We have faced our problems, but it does not lessen our needs for Federal help. We see our efforts as complementary to the Federal system. And the two programs still would not completely erase our needs.

In addition, a new Federal program should not penalize a State, such as North Carolina, that has taken the initiative. And as you have heard many times this morning that we are not getting—we feel like we are not getting our fair share back. I am sure some of the people in our area feel the same thing. What comes to State, they do not get the full amount back. But, that is something we have to live with. We want to make sure that the funding level and categorical formula criteria and matching ratios for any future Federal programs are developed independently of the State initiative. No State should be directly or indirectly penalized for trying to take care of its own needs.

Of course, finally, let me set it clear now. I am—have been connected with the trucking industry for over 40 years and am still connected with it, so I am hearing what you asking about trailers and so forth. But, we believe the Federal motor taxes should not be raised unless they are going to be used for transportation purposes and not to erase the national debt. As a result of our highway program, North Carolina raised its motor fuel tax by about a nickel a gallon, which makes us—as you have heard—one of the highest in the State—in the country. But, we did not get the flack that I thought we might because under our bill, the people will see where their money is going and they will be given an annual report of how it is being spent. And I do not believe the people of this State will support a gas tax increase that is not directly tied to transportation improvements.

Again, thank you very much for taking time to come to our State and allowing us to participate and share our thoughts with you on this matter.

[The prepared statement of Senator Goldston appears on p. 3264.]

Mr. MINETA. Senator, thank you very much for your very fine testimony. Your State has really become a leader with the 21¾ cent gasoline tax that is combined, and I know that what you said about people willing to pay because they are going to see the results of that. This kind of a user fee is really a solid approach. Just recently, in the June election in California, voters there decided to—yes, that they are willing to increase the state gasoline tax to new heights—doubled it to 18 cents—so, just in terms of the state

gasoline tax. So yes, they are willing to pay, knowing that they are going to see the results.

Now, your study commission that you mentioned appears to have taken a comprehensive look at the State's current and future transportation needs. What did the commission find was the most pressing problem in North Carolina—that is, new construction, more capacity on existing roads, maintenance, bridges—where did they point to?

Senator GOLDSTON. Well, as you noticed, we sort of prioritized it. Number 1 was to get some of our counties that really have a long way to go to get their four-lane road—down east, for instance, down the Outer Banks—you have to drive about 100 to 125 miles to get to a four-lane road. Up in our mountain areas we have up toward the northwest in my district, we do not have a four-lane road. You have to go a right good ways to get to a four-lane road. And of course, that is very important. We have to have these economic corridors. Nobody is going to put a plant on a road that is very difficult to move his trucks in and out. So you have got to make it accessible. And to me, it makes more sense to bring the roads out so we can get industry to locate in those areas, rather than to congregate people into urban areas. So you see what infrastructure programs—that does.

Mr. MINETA. What do you do in, let us say, outer banks or the mountain areas where you say you want to go to a four-lane road. Let us say you have a heavily populated area where you already have a four-lane road. Maybe that has to go to six lanes. Maybe it is—I am quite sure you have blood alleys here in North Carolina.

Senator GOLDSTON. Death Valley.

Mr. MINETA. That are four—four or six lanes that are crying for funds and, yet, you want to do, let us say, four-lane roads in the mountain areas, outer banks and—so, how does this get weighed in terms of where those resources get directed?

Senator GOLDSTON. Mr. Chairman, in our studies, that is what we did, if you will notice. We are four-lane. We are taking some of the pressure off what we call our Transportation Improvement Program, which is a 7-year program to let people know what to expect in the way of roads so that we can four lane and five lane—I mean three lane some of our interstates. Take the pressure so we can divert that money into there. But all of this has to be addressed. There has to be something for everyone because, remember, everyone is paying the tax if they have a motor vehicle. So, you cannot just say, "We are going to help the urban." "We are going to help the rural." We have got to make it a composite thing to help the rural, urban and all. And we try to balance it, and we put it in the bill, so they know which roads will be improved and to what degree.

Mr. MINETA. Now, North Carolina has already raised its State tax to address your own highway needs, and you have worked aggressively to try and meet those needs. Now, in our new legislation, we may put some language in there to try to leverage on other States to aggressively go after their own needs and try to increase their own gas taxes to provide different kinds of incentives to raise taxes to address their own needs. If we do something like that, first of all, would you favor that kind of an approach? And I suppose

you would want to have some safeguard so that those incentives do not tax North Carolinians any more.

Senator GOLDSTON. Well certainly, such as we have done and you have done in California, apparently. Because we have needs; we recognize the needs; our people recognize the needs and are willing to pay more. We should not be penalized. I am beginning to sound like a supplement to a school system. If we see we have the need, give us the flexibility to do it, but do not penalize us for doing it.

Mr. MINETA. Congressman Valentine.

Mr. VALENTINE. Senator, can you think of any formula or any method that you would like to share with us here today as to—in line with what I think Chairman Mineta was just asking you. Any way that the Federal Government can take State motor fuel tax levels into consideration when setting Federal motor fuel tax rates?

Senator GOLDSTON. I personally feel like that whatever the State does, if they have the initiative to do it, should be completely ignored in your deliberation. I think that we should go ahead if we have the need and the people of North Carolina feel we have the need. Let us supplement what the Federal Government is going to do. But as I said, do not penalize us for it. I think it would be a very complex formula and would cause as much confusion as some of the confusion in the now Surface Transportation Act if we tried to factor in formulas from every State throughout the nation.

Mr. VALENTINE. Well, let me ask you this question. I think that the gasoline—increasing the gasoline tax in North Carolina was accepted by the general public to a degree that was just amazing. I remember when the same thing was done under the previous administration, there was a lot of—seemed to be more hue and cry of a political nature, if you will pardon the expression. This time, there was—it seemed to be absolute surrender. As a matter of fact, the powers—the architect of the universe must have had a hand in it because as I recall, about the time that gasoline tax, Mr. Chairman, went into effect, the price of gasoline came down, so it did not change a bit. Is not that right, Senator?

Senator GOLDSTON. Yes sir, it did. We were looking at the futures—the gasoline futures, but it did work out—but, it did work out to our benefit.

Mr. VALENTINE. A strange thing. I take it back. I do not attribute that to any other influence—any divine thing because we had the wrong administration to get that kind of intervention.

Senator GOLDSTON. But, Mr. Congressman, if I might add, this is the one time that the people knew exactly what the money was going for. It is in the bill.

Mr. VALENTINE. Yeah. That was my thought. Not only that. But, like you say, everybody—it was spelled out clearly. And also—you people who would normally be opposed to tax increases—that sort of thing, you can see that quicker than anything else. I thought they ought to have done the same thing for public education. They did not do it. You cannot see that. But, you can see new cloverleafs and you can put fast food restaurants close by and gas stations. That is something that tickles your imagination. Suppose we were—suppose we having done that because of a situation that we regard as unfair and we are frustrated about it, and we take the bull by the horns and we pass this legislation and it is accepted by

the people, and then the Federal Government—we have got one of the highest gasoline taxes in the Union, and the Federal Government comes along to solve its problems—I am not talking about where the money goes, we are all going to agree that the Congress—it might increase the gasoline tax, fuel tax, and provide that the money go to build infrastructure. That still raises everybody up, you see. Then you have got the consumers really griping because they do not know where it came from, but they just know that somebody raised the heck out of it last year and here comes some more politicians and raised it again.

Is the General Assembly going to be under pressure to reduce the State tax?

Senator GOLDSTON. I do not think under this particular bill. I think if the Federal Government comes out with a bill that is as specific as our highway trust bill, I think the people of North Carolina would be a lot more receptive if it is going to promote their welfare and help their future welfare.

Mr. VALENTINE. But it is hard to see that coming from Washington. You can see that coming from Raleigh, but it is a more nebulous thing it seems when it flows down from Washington.

Senator GOLDSTON. Yes, but Congressman, to go ahead and tax motor vehicles, the way people in North Carolina get to work, to take care of the deficit, I think would be very objectionable to the people of North Carolina.

Mr. VALENTINE. Oh, I agree.

Senator GOLDSTON. Now if they could see that it was going to specific road projects that were going to help for years to come, welfare and getting around—we have an addiction for our cars, no question about it.

Mr. VALENTINE. Well I did not want anybody to get the impression—I am not talking about—all of us stand united, as far as I know, all of us in this delegation and most of us on this committee, certainly every member of Congress here, that money that people pay taxes for highway user purposes, gasoline tax and that, ought to be used for that purpose and not go to some other purpose.

One final question and you might want to supplement this in writing. I think that what Chairman Mineta was inviting you to do was to help us think about some ways to at least present to the Congress some way to reward States, not just put North Carolina in the position where the General Assembly might be tempted to reduce the tax, but to maybe give this State a little extra because of what it has done for itself, so as to encourage some other States to do that. And I would ask you, if you would do it, if you can think—put your mind to think about some ways that we might translate that into words that we can consider.

Senator GOLDSTON. That is a difficult task, but I will certainly attempt to do that.

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Price.

Mr. PRICE. Mr. Chairman, I have no further questions. I do want to thank you, Senator, for your testimony today and for the leadership you have demonstrated in this critical area.

Mr. MINETA. Senator, thank you very, very much for being here and taking time from your own busy schedule to testify before us.

38-253 O—91——100

Senator GOLDSTON. Thank you very much. And I can sort of sympathize with your job, the task you have facing you.

Mr. MINETA. Thank you, Senator.

I would like to now call on the Honorable Sam Hunt, a Representative of the North Carolina General Assembly, Chairman of the North Carolina House of Representatives Infrastructure Committee.

Representative Hunt, we are pleased to have you with us and want to commend you first for your leadership in what you have done and your key efforts in enacting the North Carolina highway trust fund program.

Your statement will be made a part of the record, and if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF HON. SAM HUNT, MEMBER OF HOUSE OF REPRESENTATIVES, NORTH CAROLINA GENERAL ASSEMBLY

Mr. HUNT. Thank you, Mr. Chairman. On behalf of the House of Representatives, I certainly want to join in the welcome of your Committee and appreciation for you being here on behalf of the House and our House Speaker Joe Mavretic, who helped lead the fight in the House to get the highway trust fund bill passed.

Also, Mr. Chairman, I would like to recognize the fact that we have a couple of members from the House of our Joint Legislative Highway Oversight Committee here in attendance at these meetings; Representative John McLaughlin and Representative Billy Creech, who were instrumental in also helping us in the House.

Mr. MINETA. If Representatives McLaughlin and Creech would like to come up and join you at the table, Mr. Hunt, that is fine. Why do we not have them come on up and just be seated here—that would be fine.

Mr. HUNT. I have got to brag a little bit on the House side about what we did in the highway bill. Basically—and a lot has been said—basically we made the bill big enough, fair enough and flexible enough, and we had enough accountability that when it came time to count the votes, we had an overwhelming majority. I think we had something like 92 to 95 votes out of 120 in the House. We have hardly had that many for anything. So it was big enough to where we took the old rural and urban fight out of the bill.

In other words, every time we have ever tried to do anything in North Carolina, we have got in a fight between rural and urban and nothing got done. And so we split it up to where everybody got enough and by somebody else benefiting, it did not take away from the others. So when the urban loops went it, it did not take away from the fact that we were going to pave every unpaved road in North Carolina. We were going to take everybody in North Carolina out of the dirt. And so it was big enough in terms of the four-lane roads, in terms of what the cities got, in terms of the dirt roads, in terms of the urban loops, to where everybody benefited.

It is fair enough in that we have a distribution formula that the seven major regions of the State have to go along and progress according to a formula and in 7-year increments, everyone has to have an equal share within 10 percent. And that satisfied the members. It was big enough to satisfy the public in terms of the projects

and it was fair enough to satisfy the members and it is flexible enough for the department where half the money is controlled by the TIP and we let them swap Federal dollars, where there was a Federal project, and it gives the department flexibility enough.

We have accountability where they have to come back—we formed a Highway Oversight Committee, it is a Joint Legislative Highway Oversight Committee of the Senate and House, and we get the accountability in how they are doing by region, by different types of projects. And we have taken the distrust that may have been there before and we have got the General Assembly and the department working together, and we have found that that has worked well so far.

In terms of the program that your Committee is considering, we would like to echo—and I would like to echo—flexibility. I think every speaker I have heard today has asked for flexibility and I know from being in the General Assembly how everybody wants everything unattached, no strings attached, and I know how that is not possible. But I think that when you do put this bill together, that the more flexibility it has for the States, the better, 50 percent flexibility certainly we hope would be the minimum.

An example of why flexibility is needed, if you look at the Federal bridge repair and replacement program, under the current requirements not more than 35 percent of these funds can be spent off system, where in North Carolina 60 percent of our needs are off system. Another part of that is, it is required that when a bridge is repaired, that it be done back to standards almost of new construction standards, when sometimes you might be able to correct a minor flaw and put the bridge in pretty good shape and it would be more cost-effective to do it that way than to have to spend more money on the bridge than necessary, because the needs are so great. I cite that as one illustration.

I would—I think you have got the flexibility point pretty good here today, so that I would just say the vehicles miles traveled and those type of formulas certainly are what North Carolina wants, fuel consumption, population as opposed to land area or cost of improvements.

But we appreciate the opportunity to come here and testify before you and hope that—wish you well in your efforts to craft this legislation so it will benefit North Carolina. [Laughter.]

[The prepared statement of Mr. Hunt appears on p. 3278.]

Mr. MINETA. Thank you very much, Representative Hunt, for your statement as well as for your past leadership on this whole issue. As you said, you are the cochair of the Joint Legislative Highway Oversight Committee.

Mr. HUNT. Yes, sir.

Mr. MINETA. Let me ask with regard to these seven localities that are going to be getting the funds over the seven-year period. Are those seven geographic areas also going to have to have some kind of local match of their own in order to bring these State funds in?

Mr. HUNT. No, Mr. Chairman, the formula excludes the urban loops because every region doesn't have an urban loop and it excludes the unpaved roads that are being paved, because some areas have more unpaved roads than others, so they are out of the for-

mula. But other than that it is strictly a combination of the Federal and State money in the seven geographic regions, which what we did was took—we have 14 highway districts and so we combined two highway districts, and by combining the two highway districts it gave the department enough flexibility in terms of some projects being further along in planning than others. So it was a matter of flexibility that we reduced it to seven.

Mr. MINETA. And how have you enhanced flexibility by freeing your seven geographical areas of some of the federal restraints?

Mr. HUNT. Well of course we still have the federal restraints on any Federal project, but what we allowed in our bill was that any of the Intrastate System, you might could call it highways of State significance, that we were going to put the money in, that were any projects that were eligible for federal money, they could use Federal money on that and then that would free up State money to go into bridge repair or whatever.

Mr. MINETA. Do you know offhand what percentage of dollars the program earmarked for rural areas as opposed to more urban areas, as well as how the General Assembly arrived at this funding split?

Mr. HUNT. The money in the highway trust fund is tilted slightly—I could stand corrected on that, but I think in the rural favor, but at enough to answer the urban needs and also by increasing the funds, it helped the cities also. But I think, you know, there again if we have a better situation under the Federal—new Federal plan—of course that will be helpful.

Mr. MINETA. The fact that North Carolina has increased its State motor vehicle fuel tax, we may be—given what is happening with the Federal budget and the meeting of the budget summiteers up there, we may be facing an increase in the gasoline tax at the Federal level, and hopefully those summiteers will allow that money to be spent for transportation infrastructure programs. How do you think your constituents would react to that?

Mr. HUNT. Mr. Chairman, I think it's essential for public support and confidence that—it certainly has been in North Carolina, and I feel at the Federal level it is the same way, it is the same taxpayers—that the money be spent for the purpose it is raised. And I think we have established pretty clearly a precedent that the people that use the roads ought to pay for them and I think if we start asking them to pay off their road usage for something else, it will deteriorate public confidence and it will be a step backward.

Mr. MINETA. Well we want to be sure that the gasoline tax, if it is adopted by the budgeteers—by the summiteers, I should say—that by golly, they do make sure it goes into transportation infrastructure and not divert it to deficit reduction. As laudable a goal as that may be, to me it takes the trust out of a trust fund, if we break that linkage between gasoline tax and transportation infrastructure projects.

Very well. Congressman Valentine.

Mr. VALENTINE. Mr. Hunt, did not the General Assembly in North Carolina at last session go into the—do the very same thing that we are concerned about here? That is, take part of the money that is collected from the gasoline tax and put it in the general fund?

Mr. HUNT. Congressman, from the time the ink was dry on our highway trust fund bill, there were people who wanted to obtain money from it for other purposes. It started out there was $106 million that they wanted and then it was $30 million annually on a permanent basis. Because we have developed this strong support through our oversight committee and the members being involved in what is going on in transportation and the money being used for the purpose intended, we were able, particularly in the House, to defend that and it ended up that they did get one time $17 million, and if revenues come in as we hope they will, that will be repaid to the highway fund, so that we will not lose anything.

But we have had to fight the same thing that you are hearing with the summiteers, but I am happy to say, with members of our oversight committee and Representative McLaughlin in the Appropriations—he is the highway fund chairman in the Appropriations Committee on the House side, we were able to do pretty well under current circumstances.

Mr. VALENTINE. But they did get some of it though, did they not?

Mr. HUNT. They got some, subject to repayment.

Mr. VALENTINE. And is that written in the statute?

Mr. HUNT. Yes, sir.

Mr. VALENTINE. And that was money that the General Assembly, under those circumstances, did authorize them to take from the fund, the user fees that we have been talking about, a diversion to help support public education but the General Assembly—they have the knowledge that they will have to revisit that, that that cannot be—you know, will not just drift along and get bigger and bigger.

Mr. HUNT. Congressman, that is correct. In other words, this was a 1-year only, and I will not go into boring you with all the details of what it was, but it was money had revenues not been down, they would have got anyway. And if revenues increase, we will get it back. So it was strictly a 1-year thing and we were quite pleased to end up with that situation, considering what they wanted.

Mr. VALENTINE. Can you tell us, Mr. Hunt, generally what other sources of revenue—from whereabouts does the other money come in our state, tax funds, to support the highways and infrastructure? In other words, what happens to the money for automobile license plates, drivers license, that sort of thing?

Mr. HUNT. Yes, Congressman, as part of this bill, in addition to raising the gas tax to the level it is, we also put a use tax on—highway use tax on automobiles of three percent, which was the biggest single component of our bill.

Mr. VALENTINE. Does that have a cap on it?

Mr. HUNT. It has a thousand dollar cap now and will go to $1,500 in I think another year or 2 years. And then we raised the title fee, which was another big component, from $5.00 to $40.00. In other words, about every—it was a potpourri or smorgasbord of taxes everywhere, and fees, that we could come up with the amount of money that we needed because we could not get the $9 billion on gas tax alone.

Mr. VALENTINE. Now I want to ask you a question, and I want you to know that I know the answer to it. I just want you to tell Congressman Mineta. [Laughter.]

Mr. MINETA. That is always true of every question he asks, he always knows the answer.

Mr. VALENTINE. The way that we build highways in the State of North Carolina—this was alluded to by previous witnesses—if Charlotte wants to build highways and streets within the corporate limits of the city of Charlotte, they can use tax money that is collected in Charlotte in any way they want to, can they not, to do that?

Mr. HUNT. I think they can.

Mr. VALENTINE. But they do not have any additional revenue use taxes. There is no additional tax—when you buy gas in Charlotte, there is no way they could charge an extra penny per gallon or anything of that kind.

Mr. HUNT. They have asked for that but they have never had that authority.

Mr. VALENTINE. That is because of the fact—and the same thing applies to Mecklenburg County and Wake County, which goes back to the fact that the State of North Carolina finances—levies the tax and builds the highways, is that not right?

Mr. HUNT. That is right.

Mr. VALENTINE. So you do not have a situation like you do in some places in this Union, as I understand it, where a county will build the roads. No counties build any roads in North Carolina, is that not right?

Mr. HUNT. That is correct.

Mr. VALENTINE. So you do not have—when Chairman Mineta asked you the question about when you divide this money up and this region gets this part and this region gets that and so on, there is really no way for the region to make a contribution to this except a city can build streets, is that not right?

Mr. HUNT. That is correct.

Mr. MINETA. Would the gentleman yield on that?

Mr. VALENTINE. Yes.

Mr. MINETA. So things like a driver's license fee or a motor vehicle registration fee, that is not by formula shared with local government or with a county commission, it all stays at the state level.

Mr. HUNT. That is correct.

Mr. MINETA. Thank you.

Mr. VALENTINE. Has any consideration been given recently, as far as you know, to changing that? That is to look at the situation in the rest of the country and see what other states are doing and if it is time for us to make—you know, not suggesting that anybody knows better than you all what to do, but I think it is always a good thing to find out what the competition is doing and see if it is time to make some adjustments in that area. I just mention that.

Mr. HUNT. Well certainly I am more prejudiced to the way we do things in North Carolina.

Mr. VALENTINE. Oh, I am too, I do not want you to interpret anything I say as any disloyalty. [Laughter.]

I think it is best too. Even though we still stay last in a lot of places, I think it is best.

Mr. HUNT. I would not have a comment on that, Congressman.

Mr. VALENTINE. Okay. I am almost finished. You talked a lot about flexibility. Is flexibility not one of the things we have been suffering from, in the sense that when you look at the word flexibility and the ways that Congress provides discretionary ways that people in the Federal Government can make money available at their own discretion—is flexibility not one of our problems? Do we not need—is there not too much flexibility in the bureaucracy in what they do with mass transit? Do we not need to tell what the formula will be? Do we not need to direct the people that North Carolina will get more than a nickel out of every dollar? Is that not too much flexibility?

Mr. HUNT. Well I think it depends on how you define the flexibility, but we want to be able to get our share of the money and when it gets here do what is needed with it rather than what is directed. Now however you can define that, I think that once the money comes to North Carolina under the existing things that we have done, I think you can be pretty satisfied that it is going to be done in an appropriate and fair manner and it will be supported by the people who pay it. Other States may not have that structure that lends itself to that. And certainly it might be—if I read your question like how can you have flexibility and some control at the same time to make sure it is done like you intended. It could be some type of certification or accountability that if you are doing—if you are maintaining your Federal system properly, then you do not have to go through all the red tape, and those who do not do it properly, maybe they do. So you know, it could be some States——

Mr. MINETA. Would my good friend yield at that point?

Mr. HUNT. Yes.

Mr. MINETA. But that flexibility—and as you say, the definition of it may depend on who is speaking, a mayor have a different idea as to what the idea of flexibility is, as a State representative or a city director of public works may have a different idea of what flexibility means compared to the secretary of transportation.

I know from my mayoring days, I used to get flexed by the State all the time. [Laughter.]

One of the things that flexibility also means is is there a good council of government or some fair place where everybody is going to be able to mix it up with give and take and then come out with a final solution. Is there a council of government or some kind of metropolitan planning organization where that mix will take place and people can really thrash it out there to come up with a plan. And frankly, as I look at the country, there are probably a handful of places in the whole country that have a good council of government or a good metropolitan planning organization where that might occur.

I am all for flexibility, but as you said, it is also a question of control to make sure, quote, "the right thing gets done".

Mr. HUNT. Well Congressman, I think one thing in North Carolina is that since we do control all the roads, you know, pretty much in the State and we do not have county systems, I think that we are in a better position to handle that than maybe where you have a State that has one strong county here and one weak county system there and it does—I think that North Carolina is better for that and of course in the past when we were building the Inter-

state System there needed to be more money—if it was not required, it probably would not have ever been built as fast as it was, so that now that that is completed, we need to be able to use some of that money in other places.

Mr. MINETA. Well let me ask you, where does that coordination occur of a city doing its thing and the State doing its programs and all of a sudden you have got, let us say, a four-lane highway that comes to the city line. What is on the other side of that city line, it may be a two-lane road there, so where does that coordination take place?

Mr. HUNT. That is still a State highway. In other words, a State highway can go through a city.

Mr. MINETA. You see, one of the things I see wrong with what has happened in terms of the Interstate Highway System—we built a great system between cities and we came to the point of getting to the city and then we dumped all that traffic into the city and said okay, it is all yours now. And then the cities would come back and say hold it, we now need a bypass around our city because of what is occurring. So when you see these beltways, so to speak, being built around cities because of what the Federal Interstate System did, I am wondering what is going to happen here in terms of the aggressive program you have undertaken and what kind of coordination is there between local governmental agencies and the state as they come up with their plans.

Mr. HUNT. Well the flexibility that we have in our Intrastate System is, depending on the traffic and the situation it depends on whether there will be a bypass, an on-grade crossing or an interchange, and that will be upgraded as—you know, the more you build, the same thing happens with the Federal program, they develop and get more traffic and so you have got to upgrade it. But those decisions, we feel like we need to have some more control over that in the States, recognizing that you have responsibility to make sure it is not out of balance.

Mr. MINETA. I appreciate the gentleman yielding.

Mr. VALENTINE. I cannot let this flexibility thing pass without sharing with you a little political history. There was a Member of Congress from my home town by the name of Harold D. Cooley, who served in Congress for 32 years, he was chairman of the Agriculture Committee. He had a big problem with a thing called flexible price supports, flexible supports. To dramatize his aggravation with that sort of thing, he would go around with a rubber walking cane and he would stand up and say this cane—look how this cane supports me, flexible price supports, and of course he would press it to the ground and it would buckle. So when you get into flexibility sometimes you come to a contradiction in terms as you do with flexible supports—at least that is what Mr. Cooley contended.

And I see that you all obviously do not find that as interesting or amusing as I did. [Laughter.]

One final question. Do you think that there is any solution to some of our problems that you would like to discuss with us to going down to some of these wonderful sections in eastern North Carolina—we do not have big enough cities to generate toll roads and movement of traffic and that sort of thing like the New Jersey Turnpike and even Richmond-Petersburg. But where there has

been great hue and cry for the construction of bridges going back through my political life, to go down and say we will build you this bridge, the bridge is going to cost the State $30 million and we are going to let the taxpayers put in a couple of million and we are going to put a toll on it. Then you can get from here to there and you will not have to bother with a ferry, you can get to your job and this place and that place.

Do you not think that it is time for us to give some thought to that, free up some money, when you have to build bridges down in that part of the country, sparsely populated? It takes a lot of money, they are entitled to means of transportation—you know what I am talking about, there are some places where you can look across the river and you get across there on a ferry with just a few miles, but the population is not such that you are required to spend a lot of money. What do you think about solving that problem with tolls?

Mr. HUNT. Certainly I think toll roads are something that is being discussed and studied, and where it would be appropriate, you know, I think it is a good idea. There has to be enough traffic to pay for it, that is the biggest problem in North Carolina, outside of a few bridges or isolated places, is to have enough limited access traffic going between two points to justify the cost of the toll road.

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Price.

Mr. PRICE. Thank you, Mr. Chairman, I would like to pick up on Mr. Mineta's earlier point about regional authorities and the extent to which over the long haul we are going to factor effective regional planning and coordination into the system. We do have, of course, councils of government, we have more and more discussion anyway of regional needs for environmental protection, regional needs for some kinds of mass transit alternatives and so forth.

How do you see that kind of regional plan—I realize we have a State-centered system that is about as centralized with the state as any in the country. I wonder though down the road how we factor effective regional planning into the system.

Mr. HUNT. Congressman, while we do have a central system, I think we do at the same time have a regional approach with the 14 highway divisions, the engineers and the board members and the planning that we are doing, you know, with our TIP, 7 years out. I feel personally confident as to the approach our department is taking on that and I know, speaking for our region, which is the Piedmont, Guilford, and Alamance, that area, we do not see that as a problem.

Mr. PRICE. That will be a question, of course, that we would need to take up with our mayors and local officials later today.

Thank you, Mr. Chairman, I have no further questions.

Mr. MINETA. Well Representative Hunt, let me thank you very, very much for your leadership again in this issue and I appreciate Mr. McLaughlin and Mr. Creech being here as well. We appreciate your leadership, especially on the appropriations side, that is a very, very important part of it, Representatives McLaughlin and Creech, so again, thank you very, very much for your presence here.

I would now like to call on those who really have to answer to constituents, mayors. The Honorable Avery Upchurch, mayor of the city of Raleigh. I would like to have Mayor Upchurch come before us at this point. Having been a mayor myself, I can appreciate very well—it is an exciting job, exciting position that you are in. So let me go ahead and submit your testimony for the record, and if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF HON. AVERY UPCHURCH, MAYOR, CITY OF RALEIGH, NC

Mayor UPCHURCH. Thank you, Mr. Chairman, Mr. Valentine and Mr. Price, I am pleased that you are in our region holding these hearings.

Also, I was very attentive to the comments that you made on behalf of Mr. Valentine, even though Mr. Price is my Congressman, if someone were to mention Congress to me, I would think of Tim Valentine. Being a mayor, there is no committee as important to us as the Public Works Committee. So your entire committee is the one that I listen and watch most often because you certainly do play a major role in all the things that we are attempting to do. You know what has happened in recent years as cities have taken on more and more responsibility, and we have faced some major ones and I feel like today my comments will not be just for Raleigh but it will be for a medium-sized city nationwide. I am on the board of the National League of Cities, so I know many of these people across the nation, but Raleigh is in that category of medium sized.

Mr. Price, I like you as my Congressman too, so I do not want you to misunderstand when I said I thought about Mr. Valentine, but there is a major role there that we do appreciate.

I believe our city's——

Mr. VALENTINE. Mayor. I apologize for interrupting you, but I must say before I forget it, I must compliment you on your testimony up to this point and say that you, thus far, have made wonderful sense. [Laughter.]

Mayor UPCHURCH. Well I will even take it further. I hope I can see the day when you are chairman of the Public Works Committee, and I have been telling you this for years and years, that you just stay there. [Laughter.]

No, he had some doubts about that committee in the earlier years and I kept reminding him that he was in the right place.

Mr. VALENTINE. That is true.

Mayor UPCHURCH. I certainly do appreciate it and the people of North Carolina do.

Let me move right along into these comments, and I am sure I am going to be using the same words that have been used before here today—the word flexibility that you were playing with a few moments ago, and I am not sure how you are going to use it against me or with me in a few moments.

I believe our city's large population, its dominant role in the greater urban and regional setting, and its proximity to State government qualify us to understand the transportation needs of the modern city.

On one hand, our problems are based on magnitude; urban congestion, safety, air quality. On the other hand, the problems relate to the legislative process; highway funding and the flexibility of regulations concerning that funding.

What are the highway concerns of the modern city? Our experience shows several, including making accurate needs projections in the face of shifting demographics; a growing gap between urban jobs and existing transportation systems for suburban areas; increased urban and suburban congestion; growing maintenance needs as capital projects reach the end of their design life; rising public transit operating costs; and federal mandates for transportation programs to reduce air pollution.

We know that these are problems that we almost must solve without additional funds, unless something can be worked out. We have already made and won a case in North Carolina and you have heard that story this morning, and I think it is a story. North Carolina cities are well underway in many street improvement programs. We spend some $283 million annually on streets and transportation. And there is some $80 million above that that we spend out of our operating budgets and I noticed a few moments ago some question about do we spend other moneys, and we do spend other monies.

What we need now is a partner, not only in funding, but in understanding the program needs we have.

We encourage a major increase in highway funding if that can be accomplished within the context of managing the federal deficit reduction. These numbers are really up to you, but the way we see it, it is really quite simple. Infrastructure improvements increase the country's productivity in greater proportion than the dollars spent. The continuing concern over the short-to-mid term economy may factor into the need for this program.

Funding flexibility. Almost as important as funding to us at the local level is a problem that Congress can more easily address; providing flexibility in spending the funds you provide. Nothing is more frustrating to citizens and officials or makes a centralized government appear more ineffectual, than to have money available that cannot be spent on obvious needs. To offer a lug wrench to a traveler who is out of gas is foolishness at its height.

Mr. Mineta, you have been a mayor, as I heard you say this morning, and you know the importance of funding flexibility at the local and State level. If the Congress truly wants to improve transportation, make the funding flexible like a block grant. Make it so we can spend it with local needs in mind, so long as we satisfy you that we are meeting the national goals you have set out. Do not pigeonhole the money so it must be spent on lower priority needs just to meet standardized goals.

The block grant concept is more in line with the realities of transportation needs funding throughout the country. You cannot expect the variety of circumstances in size, needs and investment be met by a single national program that targets its funding in such a narrow way. I feel your emphasis should be more on meeting the goals, not so much on how the goals are met.

Current highway funding categories are too restrictive and do not correspond to where local officials know and understand the

problems are. I urge you to let us match the funds with the problems. If we are allowed to do this, we can better meet the problems of congestion, safety and air quality, with solutions like outer beltways, pollution controls, urban and rural access roads and the like.

This next gets right to the heart of what was being said a few moments ago, and I would welcome a question about MPOs because I think we have a situation here that is an example. Continue the MPO process. You have heard of the three Rs, let me mention the three Cs. We enjoy an excellent relationship with the state DOT in the three Cs planning process; continuing, comprehensive and cooperative planning, as it is known. As chairman of our area TAC committee, I can speak directly and earnestly for the value of this process. I believe in the fundamental responsibility for transportation planning and decisionmaking being placed at the State and local level.

North Carolina has good experience with the MPO process. As a matter of fact, to digress a bit, we have two in this immediate area and now we are beginning to meet, and my reading for this weekend will be three consultants' reports which we have commissioned as a joint venture to study the very issues we are talking about. So we are on top of this constantly.

And then we support urban congestion management. Along the same line I have discussed with this theme of flexibility, we support the preliminary urban congestion management system proposed. For a populous city like Raleigh, where we function as the major metropolitan hub for this part of the state, we encourage the flexibility outlined in this plan. We feel that it will help us relieve congestion, air pollution and reduce energy consumption by recognizing locally-determined practical applications and technological solutions to the problems. An example of this flexibility as applied to energy savings is the opportunity to pay for a highway interchange instead of a highway intersection.

And let me just close with this little remark—in conclusion, we would like to have more money with fewer strings. What we may get is more money with more strings. But if you decide to keep the money, please keep the strings. [Laughter.]

[The prepared statement of Mayor Upchurch appears on p. 3370.]

Mr. MINETA. Very good. Well said, Mayor Upchurch. I can relate to your whole statement.

You had indicated that you have an excellent relationship with your State department of transportation in the three C planning process. However, as we review the structure of MPOs throughout the Nation, we find varying relationships among the States. Is there a need to revise the three C planning process to ensure that transportation plans support local, State, and Federal objectives?

Mayor UPCHURCH. I am not sure that I have thought of a need for revision, because as I say, we have a system that works and we do exactly what you said, we get in the room and roll up our sleeves and we have—probably the strongest debate now is are we putting sufficient funds into the transit systems that we talked about versus the automobile—roadways. We probably debate that one the most, but we are coming to grips with it.

So ours works. As I said, we did not remain in the communities around Raleigh and the communities there, we have expanded it to

jointly begin to talk with the one in the Chapel Hill/Durham area and we have a Triangle Council of Government which is six counties, and this is the heart of all of this activity, within these elements I just mentioned.

Mr. MINETA. TAC you mentioned is what?

Mayor UPCHURCH. Transportation Advisory Committee, that is the MPO, it is the same thing.

Mr. MINETA. And that is a six-county——

Mayor UPCHURCH. No, that is the urbanized area in Raleigh. Then you have it—they call it MPO, I should not have used TAC I assume, because that is the former designated, I believe, designation for the Transportation Advisory Committees, now they call them Metropolitan Planning Organizations—it is the same thing.

Mr. MINETA. Now throughout these Subcommittee hearings, we have heard two recurring themes. One is, as you said, you would like more money and the other thing of course we hear about is flexibility. Now would providing flexibility for the use of Federal aid highway funds give urban areas sufficient leverage to meet their transportation needs?

Mayor UPCHURCH. If there was sufficient funds to match the flexibility, I am sure it would. Maybe I did not grasp your——

Mr. MINETA. In other words, a lot of times if you only have so much money, you can really make it go further by having flexibility. And I am wondering in this case, given—I am hoping we will end up with more money and with more flexibility, but you have read about all of our budget problems at the Federal level, so we may not get as much money as we had—as I am hoping for. We may only get this much money. But will flexibility give you more ability to leverage the use of the money you get, to make it go further?

Mayor UPCHURCH. I can only use my city as an example. Soon after becoming mayor, that was one of the major initiatives, was a transportation improvements program in the city. We have leveraged our funds with the State department of transportation in being a partner with them in building projects that would go to a certain point and urge them to pick up. We have used a leveraging system and that flexibility, and that gets back to Mr. Valentine's or Mr. Price's reward. If you could offer the reward for those that will invest.

We are investing ad valorem tax money for the building of roads in my city. We took on that initiative and we issued bonds and the people approved it, and the vote was 80 to 20, 80 percent approval. So we are actually in a position, and we have many projects within our city that we have actually worked with the department of transportation in a joint venture and we are building roads, we have probably some 43 projects in and around our city and some of those are $10 to $20 million projects. They are not all just small bridge replacements.

Mr. MINETA. You require what, two-thirds for general obligation bond passage, or is that just majority?

Mayor UPCHURCH. Majority, just a majority.

Mr. MINETA. And then the population of Raleigh is what, roughly?

Mayor UPCHURCH. 220,000.

Mr. MINETA. Very well. Thank you very much. Mr. Valentine.

Mr. VALENTINE. Mayor, would you, without taking up a long time, just give the chairman and our other visitors just kind of an overview of the situation in this area, the population increase in Raleigh—when did you become Mayor?

Mayor UPCHURCH. 1983.

Mr. VALENTINE. And the growth from 1980 to 1990 in Raleigh-Durham/Research Triangle Park, the airport and that sort of thing. The population figure, is that what you anticipate population will be after the census?

Mayor UPCHURCH. The census—we were estimating from our planning department that it would be 225,000, the preliminary estimates are looking about 210, so I was kind of hitting in the middle there. In 1980, we were 149 and that growth is similar to the other parts of the region, Raleigh-Durham-Chapel Hill area.

Mr. VALENTINE. And Durham would be approximately what?

Mayor UPCHURCH. I think they are probably 160-70,000. I am really pulling that one out of the air. Someone will be here from Durham later.

Mr. VALENTINE. Well a lot of things have happened around in the area, road construction, over the past several years. Raleigh is now completely belted, so to say. There is an inner loop——

Mayor UPCHURCH. Yes.

Mr. VALENTINE [continuing]. And the outer—the plans are for an outer loop?

Mayor UPCHURCH. That is correct, it is supposed to eventually be a total loop, but the original part will be connecting the 64-264 corridor with the Outer Banks, Nag's Head-Manteo area into Highway 40 at the airport. So that is probably 30 to 40 percent of the total loop that will eventually go around the city.

Mr. VALENTINE. Is there a way you could describe for us by mileage or any other way, the paving that has occurred, the other road construction, the improvements, extensions and widening in this Raleigh-Durham-Chapel Hill area over the past ten years?

Mayor UPCHURCH. All I know is that within a five-year period, we have either completed or have under construction some $120 million of roads in Raleigh. Now you need to go to DOT records to find out what it is for the immediate area, but that gives an example of how much we are investing within our city.

Mr. MINETA. I am sorry, what was that time period, $120 million in what——

Mayor UPCHURCH. We began the program in 1985 and actually probably completed the first project in 1987, so we are cutting a lot of ribbons now. You know, those are rewarding days when you cut the ribbon.

Mr. MINETA. Absolutely.

Mayor UPCHURCH. And our people—as was said by Mr. Hunt and I believe Senator Goldston, the people of North Carolina accepted paying for this transportation system and the people of our cities, as I said, they voted for the bond referendum. And overall, I do not find an objection to a system that can be planned and improve the roads for safety, air pollution. We are a mobile society and if we do not protect that mobility, I do not think we have much future.

Mr. VALENTINE. Mayor, I want to say for myself, I do genuinely appreciate what you said earlier in your testimony. I remember those discussions, I did think about making some changes, but that is in the past. I do not have any—I want to say for the record also that I do not have any aspirations to be chairman of the committee as long as Mr. Mineta is on the committee. [Laughter.]

Mr. MINETA. I heard that distinctly.

Mr. VALENTINE. One final question. I would like to ask you, Mayor Upchurch, and indeed anybody else here within the sound of my voice, to invite you to consult with the wise men that you have access to and give us—give me and our subcommittee, your advice as to how we might try to craft—try to formulate something to present to our colleagues or to consider presenting to our colleagues, that will reward states that have done what North Carolina has done, and not penalize them. Now that is going to be a neat trick, because as I see it on the face of it, it is going to be taking the position that if you have raised your taxes to solve these problems, we are going to give you more Federal money. I think it has to have that in it, but I would ask you to give that some thought and share your ideas along those lines with us.

I do not have any further questions. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Price.

Mr. PRICE. Thank you, Mr. Chairman. Mr. Mayor, I would like to add my welcome to this hearing this morning and commend you for the leadership you have exercised, particularly in transportation areas, as mayor of Raleigh. That leadership is widely recognized to be outstanding.

You have testified very strongly about the need for flexibility, the fact that the current funding categories are too restrictive and do not correspond to where local officials know the problems are. Could you elaborate on that? As this committee looks at this legislation, tries to improve the statute in the future, could you elaborate on how the rigidity of present categories have held us back, the kinds of specific changes you would want to see?

Mayor UPCHURCH. I thank you for the question. I am not in a position this morning to give you detailed specifics of various cases and situations in which we have had to deal with conditions that maybe curtail or either delayed or almost prohibited some of the projects that we are dealing with, but each time we go into one of these projects, there are many requirements and regulations that we are confronted with that makes it more expensive. However, there are certain environmental requirements that some people become very alarmed if we move a project forward and because we will not have to meet a Federal requirement—we just need to put our heads together and work out a plan in which we can build projects that meet local needs and at the same time does address what the Federal Government is requiring be done, because every region, every area of the nation is not alike, is not in the same situation.

Mr. PRICE. Let me just invite you to submit for the record if you would like some of the specifics along those lines, especially in terms of the funding categories and the way they might be made more accessible to you. We would welcome that kind of specific testimony as we get—move the legislative process along.

You talked about the MPO process and said you would welcome a question about that. I would like to give you the opportunity to elaborate on how that has worked here because I think we all recognize the importance of that kind of planning.

Mayor UPCHURCH. Well I can recall very distinctly back in the early 1980's, it was not that important. We were just really beginning to grow and become a stronger region. I have chaired this one in Raleigh since the beginning, since I became a council member, and I have seen the expansion into other communities; the Marshvilles, Carys, the Apexs, the Garners and then the greater Raleigh area, and the same thing has happened in the Durham and Chapel Hill areas. And so we have been working with one another as we built plans for the outer loop. The outer loop was planned because we were all working together.

The counties basically were not too involved with that decision because they do not build roads, but they have land use control which is so important to transportation planning. So they have entered the picture and now we have the county commissioners and they have become more involved in transportation than they were at one time because again, council governments are counties and cities.

So I almost feel that we have an ideal situation in that we are meeting—we organized the regional transit authority which came out of this very group, as the forerunner of transit authorities in urban areas of North Carolina. That has been organized, is moving forward and in a few months I believe, we will have actual activity, whether it is bus or rail, there will be something taking place because the MPOs, with the council of governments worked together.

Mr. PRICE. How many jurisdictions are involved in that authority?

Mayor UPCHURCH. The authority is the Raleigh-Durham and Chapel Hill, three counties, three counties out of the six. These are the urbanized. But see, the towns of Chapel Hill, Raleigh and Durham have transit systems and then in the middle we have the Triangle Park where there is none. The Triangle has become the hub of the transit system.

Mr. PRICE. We have heard a good deal of testimony this morning about the imbalance between what North Carolina pays and what we get back in terms of transportation funds in general. That disparity is especially striking in the mass transit area.

Mayor UPCHURCH. It certainly is, and I have read the records of the dollars that have been spent in the districts of some Congressmen that I will not mention today, and that is the reason I follow the Public Works Committee so well, just observing how these moneys did go into some of these areas. And I recognize there are no monies available any more for establishing, initiating or planning or building one of those systems. We have come up short in this and we certainly need to look for assistance.

Mr. PRICE. Well there is a strong implication that one of the problems is that lack of flexibility that you identified.

Mayor UPCHURCH. That is right.

Mr. PRICE. That the way that mass transit assistance is defined, the kind of criteria that are contained in the law, simply prevent us from making an effective application for those funds. You talk

about the discussions that have gone on within the region about highway needs, our public transit needs. What kind of changes are going to be required in federal law in order for us to get the help we need, to do better than a nickel on the dollar, and of course the point is not just to get money for money's sake, but to be able to address the needs that we all recognize that we have and are going to have in the years ahead.

Thank you, Mr. Chairman. Oh, I am sorry.

Mayor UPCHURCH. I appreciate the homework assignment that Mr. Valentine and Mr. Price gave me, and I did record that mentally and I will go back and try to respond to those two questions.

Mr. PRICE. And if I could just add to that. I think whatever reflections you have on what it is going to take, what kind of changes it is going to take to enable us to apply effectively for assistance in this mass transit area in particular.

Mr. MINETA. Well Mayor Upchurch, thank you very, very much for your being here today.

Mayor UPCHURCH. Thank you, sir.

Mr. MINETA. I would now like to call on the Honorable Lucy Allen, mayor of the city of Louisburg. We are pleased to have you here, and you may go ahead and proceed in your own fashion.

TESTIMONY OF HON. LUCY ALLEN, MAYOR, CITY OF LOUISBURG, NC

Mayor ALLEN. Thank you, Mr. Chairman. Mr. Chairman, Congressman Valentine, Congressman Price, ladies and gentlemen, I am Lucy Allen, the mayor of Louisburg, North Carolina. I am afraid it is a town, not a city, just under 4,000 in population. But when it does come to the needs of transportation, perhaps I can speak for much of North Carolina because ours is a State of small towns. We have 506 active municipalities and nearly 50 percent of our population is municipal, 90 percent of our towns have fewer than 10,000 people.

Mr. Chairman, you have heard many facts about North Carolina's highways today that your subcommittee should know, and I may be adding to that refrain and repeating it and I hope that will mean you remember the song when you get back to Washington, and hum it every now and then.

Our State does have a highway network of more than 76,000 miles and it is the largest State-maintained system in the nation. The State is a major trucking center for the country with over 700 trucking firms providing service to virtually every community. In addition, there are more than 14,000 miles of municipally-maintained streets. Yet you have heard that North Carolina is a transportation donor, and nowhere is that more apparent than in our return for rural highways. The need is great and the return is small.

As a mayor, I have been active statewide and nationally in discussing the problems and opportunities of small cities and towns. From where I stand, none of these is more critical than transportation at the local level. To put things in perspective, there is no national transportation problem, but a series of individual and local

transportation problems that, taken together, do constitute a national need, beginning in the small towns.

Urban and rural areas are now and always interdependent. Rural areas and small towns need safer and better road access to urban areas for shops and for jobs. Urban areas need access to a labor force and markets. Because we understand this locally, cities and towns in North Carolina are in the roads business as never before.

I want to impress on you four things about transportation programs and transportation funding.

First, the need for rural access.

The need for significant national investment to augment local funds.

The continued need for local involvement in transportation planning.

And the implication of other decisions you as Members of Congress will make that control the destiny of highway funding.

As to rural access, past transportation policy has focused mighty heavily on urban and interurban transportation needs while failing to adequately fund transportation needs in rural areas and small towns.

In the strongest and simplest terms, adequate funding of rural access is important as a way of building up our urban areas.

As you discuss and debate terms like "roads of national significance", keep in mind that in North Carolina and much of the country, it is small cities and towns like Louisburg that will provide the growth, vitality and economic progress for areas like Raleigh, Charlotte, Atlanta, Baltimore. It is we, and hundreds and thousands of areas like us, who will fuel the engine of their prosperity. This strategic importance must be recognized and planned for in the funding of highway programs, and I present that as a basic need for your committee to address.

Local and State investment. Local governments have been raising and investing local dollars in transportation programs while the Federal Government has been retreating in its responsibilities. Nationally, the Federal share has reached its lowest level in 27 years, according to figures from the National League of Cities, while the local share has risen from 41 to 53 percent. Between 1984 and 1987, the Federal share dropped from 31 to 23 percent and all States' share from 29 to 24 percent. We might not remember the percentages, but the trend is significant.

In North Carolina, this picture is dramatically different. Ours is a true partnership in which the State understands the return on investment from highway expenditures and has put its money where its mouth is. More than $80 million is made available to municipal governments for local street improvements and maintenance, and in addition, the State raises and spends $1.1 billion for its basic State highway funding program.

You have heard about the major new initiatives that the 1989 General Assembly passed in legislation to finance $9.2 billion in new highway improvements over the next 13.5 years. This measure established a new highway trust fund and uses revenues from a gasoline tax hike, as you have heard, and other highway use tax increases. The trust fund will finance an Intrastate System of four-

lane highways throughout North Carolina putting every city and town within 10 miles of a four-lane quality road. My town of Louisburg is exactly 10 miles from U.S. 1 and because of this new program, U.S. 1 will finally be four-laned after decades of delay. Also funded are loop roads in some urban areas and paving of 10,000 miles of secondary roads. We have embarked on an ambitious plan in North Carolina, but we need Federal rural access money to accomplish this work fully. We could also do more if the Federal money we were receiving for our State—a State of our size and complexity—were more equitable. Unless more rural access money is made available, areas like mine will be penalized.

As to local involvement, fundamental responsibility for transportation planning and decisionmaking should be placed at the State and local level. Local governments should have the authority and the flexibility to ensure that transportation plans support local objectives and satisfy local needs. I am active in our region K council of government and planning and the State helps us very carefully with our local thoroughfare plans in towns such as Louisburg, to coordinate what the State will be doing with what local needs are.

Speaking for just a moment, our highway board members, Jim Peden and Nancy Rand, work very, very closely with localities to make sure that decisions fit into local plans. In very much the same way, where there are overriding national or statewide transportation concerns, Federal and State Governments have a legitimate role in planning and decisionmaking, but local governments should never be excluded from these processes.

Finally, I want to touch briefly on topics that I hope you will give more attention. The Congress' search for more money to reduce the national deficit should not undermine basic principles of equity and good government.

Municipally we oppose eliminating the deductibility for State and local income, sales, property and real property taxes. The loss of deductibility will make it much more difficult to raise local revenues. It will put pressure on local governments to reduce spending for important projects. It will lower bond ratings and it will increase the cost of municipal borrowing at a time when city infrastructure needs are increasing.

We support continued exemption from taxation for bond proceeds which are used to finance critical types of infrastructure facilities such as airports, roads and bridges, mass transportation facilities and water, wastewater and solid waste facilities.

We support spending down the Federal highway trust fund and I will mention the aviation trust fund, and consider it dishonest to tax for these important highway and aviation programs and not spend the money for its intended purposes. Holding this transportation money hostage increases our tax burden and frustrates citizens' reasonable expectations of government.

On September 28, my county, Franklin, will break ground, thanks to the efforts of Congressman Price and Governor Martin and Secretary Harrelson, on a new general aviation facility which will be a reliever airport for Raleigh-Durham. During that siting and planning process which was lengthy, there was much fear that the government would begin to siphon off the aviation trust fund and that small communities like ours would not have a chance to

have such facilities. We are grateful that the trust fund has remained inviolate and hope it will continue to do so.

I appreciate the opportunity to speak, particularly today for highway needs, from a small town's point of view, and hope that you will keep these ideas in mind as you return to Washington.

Thank you.

[The prepared statement of Mayor Allen appears on p. 3248.]

Mr. MINETA. Thank you very much, Mayor Allen. You are roughly how far from Raleigh?

Mayor ALLEN. Thirty miles, just directly north on 401, which is not four-lane, but which has been widened, which helps. Towns like Louisburg do not expect to have the same things that Raleigh has, but we do need to be sure that we have access in order to keep our area prosperous.

Mr. MINETA. Now in your testimony you recommend greater local participation in the transportation planning process. How are local governments being excluded under the current process, if that is the case, and what changes would you recommend for getting greater involvement of local officials into these critical decisions?

Mayor ALLEN. In the Federal process?

Mr. MINETA. In the Federal process, as it relates to this metropolitan transportation planning process.

Mayor ALLEN. In our rural areas such as Louisburg, we are not involved in metropolitan planning. I would feel that our municipal league would be glad to provide you with specific suggestions as to how you could increase the local involvement. Our transportation board has certainly made every effort to bring in people to add to their input as they work with the Federal Government. I do not have a specific suggestion, but will be glad to look into that.

Mr. MINETA. Mayor Upchurch mentioned the MPO, the metropolitan planning organization. In the case of Louisburg, are you part of this—what is it, the Transportation Advisory Committee—that is not even connected with you?

Mayor ALLEN. No, we are not, we have a local thoroughfare plan, we work within the county, which our county has just developed a county thoroughfare plan. We work within the region K organization, which is a five-county council of governments and we work with the board of transportation in submitting our ideas for the State's transportation improvement plan. We have been given every opportunity to work with our board members and our legislators to meet road needs in our area.

Mr. MINETA. Governor Orr of Nebraska has been very big on this whole issue of trying to make sure that there is rural access and you of course speak to that whole issue of rural access as being a key element of what your own needs are.

Do you have any recommendations as to how there might be a dedicated program for rural access alone, or should it be one of several options for emphasis under a flexible program?

Mayor ALLEN. I am interested in the flexibility because that would give us a chance, in North Carolina—I have very few opportunities to speak to the Federal program and I am delighted for that opportunity today. But I do not hesitate to call my board members or the Secretary of Transportation to speak within North

Carolina on the flexibility of funds and how we think they should be utilized.

I do like the idea of the block grants coming to the States and I do feel that under that type, with supervision and oversight by the Federal Government, that you are going to see very responsible planning on the part of states like North Carolina.

North Carolina is a little red hen, it is doing for itself what sometimes the Federal Government does not do and I think you have heard very adequately this morning that we feel that we should not be penalized because we are doing an excellent job.

Mr. MINETA. So you feel like here, at least, you have got a chance to speak your piece and there is some give and take in terms of how a smaller community of let us say 4,000 can get its voice heard as part of the bigger picture.

Mayor ALLEN. That is correct. We know that we cannot put the money into road projects that some of the larger cities can, but the State has offered us ways to show us that we are sincere in our effort to support our own needs and we have tried to come through with those and I feel that a balanced program that looks at rural access as a need within an entire scope and picture of the national road needs is very achievable.

Mr. MINETA. We had a situation just recently when we were in Arkansas in a hearing where the Cherokee Turnpike on the Oklahoma side is a four-lane wide highway and it gets to the Arkansas border and meets State Route 71 and dumps into a two-lane road.

Mayor ALLEN. U.S. 1 in North Carolina has been that way in some cases until recently, and North Carolina's plan now is to make sure that you do not have that kind of thing happening. We cannot be responsible for other States obviously. We do understand the interconnection of all our state systems and we do understand that each State should be expected to be up to snuff as North Carolina is.

Mr. MINETA. Good.

Congressman Valentine.

Mr. VALENTINE. Let me go back to this often-used words here today, Madam Mayor, about flexibility. Of course there is flexibility and there is flexibility. There is flexibility on the part of the—I guess it would be called flexibility or discretion—on the part of the Federal Government as to—flexibility as opposed to a set formula as to who gets what part of the Federal money there is to be given to the States. And, of course, there is the flexibility that we are talking about here as to how you would use the money that is made available to you.

When you talk about local flexibility, I assume we are talking about being able to—I should have asked this question of Mayor Upchurch—being able to spend the money for the projects that local people think—to fulfill local priorities, not necessarily flexibility to change existing highway standards as to the width of highways and what you have to put down by way of drainage and the weight limits on bridges and that sort of thing. We are not talking about that kind of flexibility, are we?

Mayor ALLEN. Not at all, because North Carolina is making a real effort, across the state we are beginning to adhere to the same standards in many ways, whether it is watershed protection or

something about roads or whatever. So we would never want to in any way destandardize that kind of thing.

Mr. VALENTINE. Yes. I would like to give you—to say first of all—compliment you on your presentation. I think that you have represented your folks very well, and I want to give you a chance to give us a little more information for our edification, for the edification of our visitors and for the record, about the town of Louisburg. It is the county seat of Franklin County, Mr. Price's district of course, and there is a small 2-year college there, right?

Mayor ALLEN. Louisburg College is a nationally known junior college, we are very proud of it. We have a great baseball program, we send many stars to the pros. So we are delighted for the chance to comment on that.

We are excited about our new airport coming and we are excited about the fact that——

Mr. VALENTINE. That is a new airport, a completely new facility.

Mayor ALLEN. Brand new, the ground has not even been broken yet, will be broken, Congressman Price will be there for that event, on September 28 and it will be playing a part in North Carolina's plan to free up congestion of Raleigh-Durham Airport by serving as an important northeastern reliever airport.

We also will be cutting a ribbon on a new road in several weeks, which the state has helped us construct with the realization that we will be able to open up an area for industrial development, which is important to small communities, that we have a place for existing industries to expand and continue to promote our own economic prosperity and self-sufficiency.

Mr. VALENTINE. How much money do you get on an average from the state under the Powell Bill, so-called, which if I might say, if we have never explained this, this is a method North Carolina has devised to—the formula whereby a certain part of the money that the State collects for the construction of highways is shared with its towns and cities, is it not, on a formula basis.

Mayor ALLEN. That is correct, on a formula basis. We are inching toward 100,000 and expect to be over 100,000 as a result of the new highway trust fund program which would increase the amount that we receive. Again, we constructed, in concert with planning with the state, the first phase of a new municipal street with that money and we are hoping that the State will help us to construct the final phases of that particular street.

Mr. VALENTINE. And are you required to spend all your Powell Bill money on street construction, curb and gutter?

Mayor ALLEN. There is a list of things for which it can be spent, all relating to either street construction or street maintenance and upkeep.

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. MINETA. Thank you. Mr. Price.

Mr. PRICE. Thank you, Mr. Chairman.

I want to welcome Mayor Allen, who is an outstanding mayor of Louisburg and well known across our district and across our State for her leadership. I appreciate her being here today.

This is a model statement, and to most of it I would just say amen. I think the points you have touched on are of great importance and we need to remind ourselves that the roads that have

earned our state in the past the designation as the good-roads State, are those rural roads, that network of rural roads that is unmatched in this country. And while naturally at the Federal level, we are going to be focused on so-called roads of national significance, it is very important that the system as a whole continue to have that kind of balance and continue to provide good rural access.

I think your comments on tax policy are of critical importance. That is not directly within this committee's jurisdiction, but it certainly is within the budget framework that we are working on right now, and it is very, very important to preserve those incentives that have been so critical to the local, State funding of our transportation facilities.

You made a powerful case about the highway trust fund, the aviation trust fund, and on that of course you are absolutely correct.

You refer to the planning process and I would like to ask you to elaborate a bit because we have heard from Mayor Upchurch about the region J process and how that has come to be a true regional process, talking about intercity needs, regional needs, really conceiving of our transportation needs in a new way. Region K of course is a much less urban region, region K is mainly rural, small towns. What form does regional plan take in that kind of area, what are the implications do you think for the way we design the next generation of Federal transportation programs?

Mayor ALLEN. Well I would think from the perspective that planning in region K is a coming together of the minds within the area on all its transportation needs—I do serve on a planning committee which oversees general planning for the region. We work towards looking at our needs, working with our legislators and the board of transportation on making them aware of those needs and it is pretty much like a set of building blocks, that I would see the same thing happening with the Federal program; that is, as we feed into the State program the needs of the rural areas, that they will continue to feed into the Federal program, the needs that we and others across the State have. We do not have as structured a planning process as the metropolitan areas have. But we do try to look out for ourselves, we do lobby constantly for the better roads because you are right, it is—back in the mid-1800s we had a North Carolina legislator who had the dream that if all of North Carolina could be connected from coast to mountains with a series of roads, and at that time ferries and such to cross the rivers which intersect throughout our State, that we could have a prosperous state all the way across, rather than having some regions which suffer because of it.

And that is what we would like to see, just the regional planning that will allow the smaller cities to reach their potential simply through their own efforts and by incentives and encouragement given to that type of program.

Mr. PRICE. Of course you are increasingly involved in the patterns of economic growth and development that involve us here in the Triangle.

Mayor ALLEN. We are in that position. As Congressman Mineta asked me where we were located—we are just north of Raleigh and

therefore experiencing some of the growth and development and problems and the traffic congestion. There are a large number of commuters from Louisburg to the Raleigh area and to the Research Triangle area and the commute gets longer and longer, not because of the distance, but because of the congestion. Yet on the other hand, we work very closely with the regions just north of us because of our actual similarity in the size of our towns.

Mr. PRICE. Well you have preserved a lot of the small town and rural amenities while enjoying some of the benefits of this growth, but there is no question that if that is going to continue, transportation is an important part of the equation.

You mentioned the general aviation facilities, the need to—not just to relieve Raleigh-Durham Airport, but also to provide that kind of facility for your own county. And of course the highway needs have escalated. I assume you believe transportation is critical to keeping pace with economic development or you would not be here today.

Mayor ALLEN. It is critical for us because each of the industries which look at our areas look at roads along with schools and the quality of life and things of that sort. They have to have the access that a good road will provide for them. The state is working with us to do that and we hope that the Federal Government will continue to work with the state to reward the efforts that North Carolina is making.

Mr. PRICE. Thank you. Thank you, Mr. Chairman.

Mr. MINETA. Mayor Allen, in looking at the map, under this new program I take it Highway 1 is going to be upgraded to four-lane. But what about 401?

Mayor ALLEN. 401 is dear to my heart and Mayor Upchurch's heart.

Mr. PRICE. Funny you should ask that question. [Laughter.]

Mayor ALLEN. It was widened, it had shoulders added to it, which has greatly affected the shape of the road, within the last 2 or 3 years. Currently the State is projecting that it will not be four-laned until sometime in the year 2010, 2015, because of other needs in the State. And we recognize that, but the State, Mayor Upchurch, the Wake County Commissioners, are hoping that it will be four-laned at least to Rolesville, which as you will see on the map, is halfway between Louisburg and Raleigh, and a great deal of the traffic will be eased because of that, should that happen. We can live with that very easily, we do not expect a four-lane highway going past every house in our state—do not even want one.

Mr. PRICE. What kind of increases have we had on that highway though, just as an example of the kind of increased use we are having in this area—what kind of increase do you suppose in the last 10 years on U.S. 401?

Mayor ALLEN. I cannot give you the actual figures. I am sure someone on Secretary Harrelson's staff could do that. But I can tell you this, you cannot pass because of the curves on it, there are usually six or seven cars in the morning for the work traffic and coming back, there is always something that you cannot pass. It probably has doubled though, within the last 10 years.

Mr. MINETA. It is pretty flat or is it hilly?

Mayor ALLEN. It is hilly and curvy and it is dangerous as it is. But it bears a large commuting traffic. It is not one of our strategic corridors going into Raleigh according to our State plan, but I think they are making every effort to utilize it as a rural access road so that those who do work in Raleigh can safely and easily reach their destinations.

Mr. MINETA. Well Mayor Allen, I want to thank you very much for your very fine paper, testimony and your excellent presentation this morning. We appreciate you being here. Thank you very, very much.

Mayor ALLEN. Thank you, Mr. Chairman.

Mr. MINETA. I would now like to call on the Honorable Robert Mays, city councilman in the city of Greensboro and a member of the Transportation Advisory Committee. Mr. Mays.

Councilman, your statement and supporting documents will be made a part of the full record, so if you would go ahead and proceed in your own fashion.

TESTIMONY OF HON. ROBERT MAYS, CITY COUNCILMAN, CITY OF GREENSBORO, NC, AND MEMBER, TRANSPORTATION ADVISORY COMMITTEE

Mr. MAYS. Thank you, Mr. Chairman, it is a real pleasure to be before you today.

Just for your information, to get your bearings a little bit, Greensboro is in the Piedmont section of the state, the center of the state, about 190,000 in population and is adjacent to the cities of High Point and Winston-Salem. We also have the nice location of having Interstate 40 and Interstate 85 go through the city limits of the city.

I am indeed honored to be allowed to address you about transportation concerns not only in Greensboro, but concerns that have been shared with me by fellow council members in North Carolina and throughout the Nation.

America, of course, has one of the most comprehensive surface transportation systems in the world, but the clock has been running on this system.

As has been alluded to by my other colleagues, as to the fact that North Carolina has the largest State-maintained system in the country, but even more importantly since 1960, we have increased our number of licensed drivers by 55 percent. Vehicle registrations have increased by 95 percent and our vehicle miles traveled has increased by 168 percent. And all of these changes with a highway system that has only increased by nine percent.

In Greensboro, we have been planning thoroughfares since 1954. Our 1954 plan was one of the first in the country and we are proud of that. Last year, we approved our new thoroughfare plan, which reflects many changes that are taking place in society. You know, change can be dramatic, such as the oil embargo of 1974, or change can be as subtle as the creation of a van shuttle service. The decisions that you make over the next year will cause a change in that pattern.

I did not come here today to tell you only about problems in cities like Greensboro. I think we each have success stories to share

with you. Thanks to a broad community-based citizen effort that focused on transportation as well as other critical areas, our citizens passed in 1988, a $75 million transportation bond program. At that time, that was the largest transportation bond program in the state. We have also as a community begun to face up to the fact that we cannot continue to build just highways, we have to take major initiatives in public transportation, and thanks to some citizen effort, a lot of staff assistance and guidance from NC DOT and UMTA, we are embarking upon that.

Today, I would like to try to point out three items to you that we feel are very important.

Preservation. We must preserve what we already have. We have established a transportation system that cannot be replaced. We must preserve that as a valuable commodity.

We must apply the necessary funds to ensure that our highways, bridges, our railroads and other transportation resources stop crumbling and be re-established to serve future generations.

I do not need to quote to you the number of highways that are crumbling before our eyes or the number of unsafe bridges that are being used every day by trains, cars and yes, school buses.

Funding does not come easy but our policy must address preservation and it must be realistic and fair.

The second point I would point to you would be the combination. We must increase our funding by combining our resources.

We at the local level realize that the Federal Government cannot solve all our problems. We know that from surveys, society believes that it is already taxed enough and many of us believe that the fairest and most equitable taxes are user-based taxes. You will be pressured to look at many funding programs, but we hope you will examine each very carefully. Our future depends on that fairness.

Being responsible and fair includes allowing local and State governments to determine their own priorities and apply those funds. Local communities stand ready, as I believe do State governments, to be partners in funding of highway, transit and other transportation needs in an open and responsible manner. We know that none of us can do it alone.

And at this point, I would say to you, Mr. Chairman, that I have followed closely my two colleagues' comments about COG's and MPO's and TAC's and I would welcome more questions on that at the conclusion of this.

My final point is that we must maximize our technology. In order to solve our transportation problems, we must pursue new technology.

In Greensboro, we are creating a public/private participation system of mass transit. This comprehensive planning method of public transportation can be applied to other areas of the country.

We have also begun the formation of a regional transportation planning organization with our neighboring communities of High Point and Winston-Salem. We have found that our problems are similar. Now we are searching for common solutions.

One common problem that we all probably will face is air pollution and we are starting to work together to develop measures to assist each other in solving.

Greensboro and High Point have joined together to fund planning studies concerning regional highway projects. We have created an intercity shuttle between Greensboro and High Point that since its creation in January is now approaching its capacity. This service is an incubator that will one day lead to scheduled bus service between Greensboro, High Point and Winston-Salem.

We have one of the most successful ride-sharing programs in the country. Municipool has been recognized by many public transportation groups as being innovative and effective at a small cost to the taxpayers.

Our planning efforts have been important in the past and will be even more important in the future. These are just some of the things that we need to continue to do and grow on.

We federally, State, and locally need to find and fund new and innovative transportation applications that are diverse and fit areas needs and the needs of its citizens.

Transportation planning has come a long way since that 1954 plan in Greensboro. We now use computers and modeling packages that tell us how effective different improvements are. The question now is will the funding be there to implement those improvements to our streets, roads, highways and bus systems.

In closing, I would hope that you and the committee remember the preservation of our systems, the combination of our funding efforts and the pursuit of new technology.

We thank you for this opportunity and let us leave here today with a clear understanding of what needs to be done. Now it is up to you and your colleagues to provide us with a program that will take our nation into the first half of the 21st century.

[The prepared statement of Mr. Mays appears on p. 3296.]

Mr. MINETA. That is very fine, Mr. Mays, I really appreciate the thoroughness and completeness of your statement.

Let me ask, you reference the organization of a regional transportation planning organization along with High Point and Winston-Salem. Would you share with the subcommittee how this new organization will fit within and might be recognized by the State transportation planning and funding process here in North Carolina?

Mr. MAYS. Yes, sir. We are very excited about this, because it is not unlike what Avery and Lucy have told you and it is a perfect arrangement, if you will, of combining rural and urban interests. What we have of course in High Point and Greensboro and Winston are three separate MPO's or TAC's. I serve on a TAC but up until just recently we were not able to put those different planning organizations together in a way that our staff could really look at the future of transportation, whether it be mass transit or road transit, together. We have over the last year had joint meetings between the groups, much the same as what has occurred in the Triangle area and I am pleased to tell you that with the state and the efforts that the State has brought forth to us as a facilitator, we are closer now to being able to put together a functioning organization that will look toward the entire region, an 11-county area, and I might digress a moment and tell you that a similar effort is called Triad Horizons, which represents that Piedmont area of 11 counties. And we are speaking to a number of different issues, but

the main point being planning and from my viewpoint as a TAC member, the main point is trying to get our road systems to understand each other's needs and leverage those needs against the short amount of money that we seem to find whenever we get ready to build a project.

Mr. MINETA. So the Transportation Advisory Committee is to the city of Greensboro?

Mr. MAYS. That is correct, just as the TAC in Winston is to Winston and the TAC in High Point. And as Lucy has pointed out before, most of your major cities have TAC's that function within the MPO's. It is the rural interest that has been recognized or dealt with through our COG system, as Congressman Price has mentioned. And we find that there is a problem with that in some regards because MPO's and TAC's have high caliber of transportation staff there for those cities to use. It puts the rural interests at a disadvantage because they do not have that staff and they are dependent upon the COG, which in many cases does not have that expertise either. So it all falls back to the State and the State cannot be involved to a high degree in every area. So I think the best idea for the future is more of a regional effort facilitated by the State, combining your MPOs and TACs into a group with rural interests that can get the job done.

Mr. MINETA. Do you see that happening here?

Mr. MAYS. Yes, sir, I see it happening right now in the Triangle area, in the Piedmont area and in the Charlotte-Mecklenburg area of the State.

Mr. MINETA. In your Piedmont area, you are doing that as TACs coming together or is that because the State is saying "now hear this, now hear this".

Mr. MAYS. There is always a little bit of that no matter what project you look at. But it is really a cry from the citizenry that came to elected officials and said, you know, you guys have to get together to do this in a more efficient manner and we heard those types of requests, and to show good faith in that regard, the easiest way to do it was to look at taking professional staff in these three areas and putting them together. And that is where we are at this point. We hope that it will then broaden out into the 11-county area, and the State has been a facilitator of that.

I have the highest regard for the way the state is able to work with us because we are not so different from a Raleigh or a Charlotte, we put money, our own ad valorem money into roads, but we are able to leverage that money with State and Federal agencies to get more roads built. And that is really where it is.

Mr. MINETA. I would like to have you explain a little bit about this ride-sharing program that you have called Municipool.

Mr. MAYS. Yes.

Mr. MINETA. It has been cited as one of the successful programs and I was wondering how—you know the old joke about "I am from the Federal Government and I am here to help."

How do you think the Federal Government could help in making a program like Municipool may be replicated in other communities or improve what you are doing right there in Greensboro.

Mr. MAYS. Well the municipal program draws on a number of Federal funds in terms of providing vans in a situation where we

can provide citizens that simply call a number with rides, coordinating them to get from their home to work. The program has exceeded our expectations because frankly the American citizen is so wedded to the automobile, it is like prying them loose to get them to ride the bus or to ride in a pool or a van. And we were surprised.

But what happened, the good thing that happened, was that through some good promotion and some good people in the city and a good facilitation between High Point and Greensboro, we have identified the routes that people seem to be using the most of and made it known to them that they can get in this van program. They have been chomping at the bit to be in the van program and we are just overwhelmed with the response.

Now bear in mind, Greensboro has not had a mass transit system other than one provided by a utility company, Duke Power Company, and because of that probably the van pool has been more successful in Greensboro than it would be in some other areas where you had a better mass transit system.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Thank you, sir.

What is the approximate population of Greensboro; that is, projected through the census?

Mr. MAYS. Well depending on who you talk to, you get a different answer, but I will say 190,000.

Mr. VALENTINE. And that will represent what kind of growth over the past 10 years, 1980 to 1990?

Mr. MAYS. Ten to 12 percent.

Mr. VALENTINE. And what would you estimate—the same questions with respect to Winston-Salem?

Mr. MAYS. Well Winston, one of the bedroom communities outside Winston, a town called Kernersville——

Mr. VALENTINE. Oh, yes.

Mr. MAYS [continuing]. Has probably the highest growth rate of any of the three cities around there, some 50 or 60 percent. They are really booming. Winston-Salem, High Point and Greensboro have all experienced very methodical one or two percent growth each year for the last 10 years. So Winston is probably 160,000, High Point is probably 75,000 to 80,000. And so if you look at the greater area then you are upwards of 300,000 for that triad area.

Mr. VALENTINE. Three-county area?

Mr. MAYS. Well it is a two-county area, Winston-Salem and Kernersville being in Forsyth County.

Mr. VALENTINE. Oh, yeah, High Point and Greensboro being in the same county, Guilford, the only county in the state with two courthouses.

Mr. MAYS. That is correct.

Mr. VALENTINE. I used to work with the State Revenue Department in High Point, there's a courthouse in High Point. That is a good way to solve problems.

Mr. MAYS. That is right.

Mr. VALENTINE. Do we understand that there is satisfactory, in your judgment, Mr. Mays, planning and cooperation amongst those three population centers with respect to local highway construction, street construction?

Mr. MAYS. Yes, sir, that is correct, and I would just say on that point, in the last 5 years while I have been on council, we have selected two projects as a group of cities that we had concerns about and were able to leverage together the funds necessary to get the EAS done on some of them and actually get some design work done. So we think it is working well.

Mr. VALENTINE. Would you care to give us more information, to illuminate briefly, the role of citizens of your city, Greensboro, and other areas—other citizens in that area—with respect to the initiatives which you have described in public transportation?

Mr. MAYS. Yes, sir. Some 4 years ago, the city of Greensboro put together a strategic planning organization, we called it Visions, and our purpose there was to let a number of our citizens take a look at different parts of government, of the community at large, what they thought was important. And one of the initiatives that came out of that was transportation, both road transportation and public transportation. And at the working of this committee, they brought to the council the request to enable us to go to referendum, to allow the citizens to vote on whether they wanted to participate in mass transportation up to 3½ cents on their tax rate. It was an overwhelming success from the electorate. They did enable us to do that and in fact we have now completed negotiations to take over the bus system from Duke Power. Duke Power paying their way out of that franchise and effective next June, we will take that over and levy a half cent against that 3½ cent possibility to help run that.

I might also add that the help of UMTA in providing us with staff to study our transportation needs was very, very important and still is important, as is the State of North Carolina.

We also just recently appointed an authority of nine citizens who will then appoint a citizens advisory committee of some 50 individuals from different walks of life to continue to keep that hands-on citizen interest in transportation.

Mr. VALENTINE. And that triad area, the colleges and universities there include High Point College, Guilford College——

Mr. MAYS. Guilford College, Greensboro College, UNCG, A&T, Bennett College and then in Winston we have Wake Forest and Salem College and Winston-Salem State, so we have plenty of colleges.

Mr. VALENTINE. And you have Bowman-Gray School of Medicine, which is part of Wake Forest and that big Baptist Hospital there.

Mr. MAYS. That is correct.

Mr. VALENTINE. Anything else you want to tell us about—no, I do not want to give you that opportunity, we will be here all afternoon.

I do not have any further questions.

Mr. MINETA. Just out of curiosity, how large is the student body at Wake Forest?

Mr. MAYS. I am not certain of the exact figure of that.

Mr. VALENTINE. 3,500. I can enlighten you further on that. That 3,500 includes the medical school, Bowman-Gray, and includes the law school I think. And the law school is completely self-supporting, they rely on tuition and they do not have any student housing. I know, I sent my oldest son there.

Mr. MAYS. Found out in a hurry.

Mr. MINETA. Well, Mr. Mays, thank you very much for your presentation and your work on the Transportation Advisory Committee. I really appreciate too your having included in your—as an attachment on your testimony, this "Commuting in America." I have had a chance to see that in the past and it is a very good analysis of our whole work force and what is happening.

Again, thank you very, very much for your presence here.

At this time, I would like to recognize State Senator Bob Martin, who is here I believe somewhere in the audience. Bob, if you are still here, if you would wave your hand or make your presence known. He walked out, okay.

Let me at this point just indicate that we will go ahead and recess for lunch at this point and reconvene at 1:45.

[Whereupon, at 1:05 p.m., the Subcommittee recessed, to reconvene at 1:45 p.m., the same day.]

AFTERNOON SESSION

Mr. MINETA. The Subcommittee on Surface Transportation will reconvene now. And, at this time, I would like to ask the Honorable Sue Myrick, the mayor of the city of Charlotte, to please come forward. I understand Mayor Myrick has an airplane to catch and would like to go ahead and proceed at this point. So, Madam Mayor, your whole statement will be made a part of the record, and so, if you would go ahead and proceed in your own fashion.

TESTIMONY OF HON. SUE MYRICK, MAYOR, CITY OF CHARLOTTE, NC

Mayor MYRICK. Thank you, Mr. Chairman. I do appreciate your consideration for my schedule. Thank you very much. It is good to have you here in North Carolina. We are grateful for the fact that all of you Congressmen chose to come to North Carolina and hear what we have to say. I will be brief. I am going to touch only on the public transportation part of my comments. And of course, I will be glad to answer any questions otherwise.

Charlotte has made a significant commitment for funding in our public transportation system through local sales tax and auto registration fees that are dedicated to public transportation. This year, we will contribute over 55 percent of the budget and 85 percent of the operating deficit for our system. In 1981, the Federal Government contributed 50 percent of the deficit. Our bus fleet and facilities have benefited from Federal capital assistance, but now, we find ourselves with almost 20 percent of our fleet over 15 years old and without sufficient Federal capital assistance to program timely bus replacements for our expanding system.

There are three aspects to Federal transit assistance: the amount of funds available, flexibility—which you have heard over and over again—and the matching ratio for fund categories.

We believe that we are demonstrating in our city our willingness and ability to provide public transportation funding. And while, of course, a greater amount of assistance would be welcome, we understand and recognize the budget constraints under which you—all of the Federal programs are operating.

Greater flexibility in local decisions regarding the use of Federal funds and in programming them over several years would offset, to some extent, the steady funding levels and matching ratios. Now, we have inadequate funds and categorical restrictions on their use. We urge you to allow local governments greater flexibility and discretion in the use of these funds through the removal of category restrictions and the establishment of block public transportation grants. We are a rapidly growing highly congested city, and we are just now reaching the size and density threshold for higher capacity of transit, which of course, in our mind is light rail. Yet, our public transportation is a key element in meeting our transportation needs.

As you have also heard today, North Carolina has received an average of less than $2 million a year from the mass transit account, while contributing nearly $40 million per year. We need more equitable access to these funds to meet our needs for bus transit and other transit alternatives. We urge you to establish a formula basis for the mass transit allocation—a minimum return to each state.

Although you do not directly—this particular—this particular is not directly related to the reauthorization of the Surface Transportation Act, we feel that there are other federal policies that significantly impact the transportation activities in the local area. And today, it is incomprehensible in a world which is choking on automobile exhaust that free or underpriced parking is an untaxed employee benefit, while employer subsidies to the employee of over $15 a month for transit passes are treated as taxable income. This sends precisely the wrong signal to commuters making their choices on how to get to work. It remains a source of great frustration for the public transportation professionals across the country.

We are also looking to the future in Charlotte in attempting to purchase and protect rail corridors that have been abandoned for future transit use. Local governments need better opportunity and more leverage to participate in the processes of abandonment, about which we are frequently notified too late and in which we are placed in a difficult bargaining position.

And just this week, we have been placed in such a position in our city. There is a piece of property that is being abandoned which we have just found out about and, of course, had not programmed into our local funding for that. And so, we are trying to figure out a way that we can do this because it would be a particularly important corridor for future light rail in our city.

I wanted to mention just two other things, too, that we are working on. One, we are in the process in our area of establishing a regional transportation authority. This is just in planning stages because there is something called the Carolinas Transportation Compact, and it is a little unique in that it involves two states, North Carolina and South Carolina—both departments of transportation working together, as well as the counties in our region that surround Charlotte as the metropolitan area. And so, we see this as a future way for us to be able to work together better regionally; but also as a way for us to be able to meet our transit needs, as well as our transportation needs.

I appreciate very much the opportunity to be with you today, and I would be glad to answer any questions.

[The prepared statement of Mayor Myrick appears on p. 3328.]

Mr. MINETA. Well, thank you very much, Mayor Myrick, for your fine statement. We have heard testimony from the highway side of the Federal Transportation Funding Program saying that their resources should be targeted to the heaviest use of highway facilities. How would you respond to someone who suggested that the same concept should be applied to transit funding; that is, that funds should be targeted in a greater proportion to those systems—especially rail systems—which have the highest ridership?

Mayor MYRICK. Well, particularly in North Carolina, I do not think that that is a fair statement from the standpoint that we are working very hard, as you have already heard—the Governor told you about the light rail task force and the train, The Carolinian, that is back on track between Charlotte and Raleigh. We feel very strongly in our State that we need intracity rail, as well as we do urban transportation systems. And so, naturally, in Charlotte, we are looking to the future to have one, and we would like to have all of the money we can. But by the same token, we feel it is equally as important that we are able to establish those relationships between the cities. So, I think it should be more of an equal sharing.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman.

Ms. Myrick, we do appreciate your taking the time to participate in this hearing and give us the point of view of the largest city in the Carolinas. What is—I know you might not have all of these figures with precision—but, what is Charlotte's budget approximately on an annual basis, and how much of that is spent for highway and street construction and improvement?

Mayor MYRICK. Well, our budget on an annual basis is about $330 million. But interestingly enough, back in 1988, we issued a bond referendum for the first time for $100 million——

Mr. VALENTINE. That was when?

Mayor MYRICK. It was in the end of 1988—November 1988.

Mr. VALENTINE. Okay.

Mayor MYRICK. It was approved by our voters. And so, right now, we have $150 million of locally funded highway transportation improvements in the hopper—I mean, actually going on—projects that are started or will be started very shortly.

Mr. VALENTINE. Will they be within—do you refer to it as the inner loop or the beltline?

Mayor MYRICK. No, they are not all within the inner loop. These are projects that range from projects within the inner loop to new corridors coming in from our heavily—where our heavily populated areas of town are, trying to provide other means for people to get into town. So, it is really a combination program. It also includes a lot of intersection improvements because we have found that just adding a left-turn lane or deleting a left-turn—that type of thing—has made dramatic differences in traffic flow through intersections. So, we do a lot of intersection improvements.

Mr. VALENTINE. When you start improving urban streets and roads, you run into a tremendous cost for the real estate when you

get involved in imminent domain condemnation proceedings, do not you?

Mayor MYRICK. We are experiencing that right now. The State of North Carolina is improving interstate--I mean Highway 74, which is Independence Boulevard, our most heavily traveled street in our area. And, that is—the right-of-way for a project like that is extremely expensive.

Mr. VALENTINE. Generally speaking, what will—how will the face of Mecklenburg County be changed or affected by the State program over the next—is it $13 and 9 years, or 9 years and—I mean $13——

Mayor MYRICK. $13 billion over 9 years.

Mr. VALENTINE. Okay. Over that period.

Mayor MYRICK. It is $9.1 million or $0.2 billion. Forgive me for not remembering exactly.

Mr. VALENTINE. What will—what will Charlotte's—Mecklenburg County's part of that likely be?

Mayor MYRICK. Well, we hope that it is going to be a major funding of our outer belt, which is the first outer belt that we will have in our city. We do not have one, like Raleigh does have an outer belt now. Charlotte does not have one. And so, we felt this is a very important part of what we need in our community to grow the way we have been growing, to handle the growth. So, that is, we hope, going to be a very important part of that.

Mr. VALENTINE. I do not want to get into anything that would ask you to divulge anything that would put you at disadvantage or be improper or confidential or anything of that kind, but were you talking about acquiring railroad rights-of-way, some of that downtown property that used to be owned by—was it the North Carolina Railroad?

Mayor MYRICK. No, this is—this particular piece is not North Carolina Railroad. This is a spur that is—I believe it is Norfolk Southern, or it may be Seaboard—I think it is Norfolk Southern, and it is right in the uptown area. We had already acquired one piece very close to that for what we hope is going to be a new NFL stadium. That was part of that land purchase. And so, we went ahead and purchased that piece——

Mr. VALENTINE. You have purchased it or have options on it?

Mayor MYRICK. We are in the process right now of doing that—as part of that purchase with the land. This piece is adjoining that, and it is another one we did not realize was going to be coming available.

Mr. VALENTINE. The North Carolina Railroad and the Atlantic and—whatever the name of it is——

Mayor MYRICK. Right.

Mr. VALENTINE. I do not know whether that is unique in this state, but as some other witnesses that pointed out that the State of North Carolina owns those extensive right-of-ways, and it has been leased to other railroads, like maybe the Norfolk Southern or——

Mayor MYRICK. Right.

Mr. VALENTINE. I used to be an attorney—which is a little piece of political patronage way back there—an attorney for the North Carolina Railroad, and the lease was 100 years and it ran out or

was about to run out. It seems to me that—I recall that the State, in connection with that right-of-way business, owned a lot of land in downtown Charlotte—not just along the railroad tracks, but a lot—you know, the railroads used to acquire extensive property on each side of the tracks. That in the heart of that city, a significant amount of real estate was owned either by the State and leased to some railroad or by the railroad. And, how would—and I understand what you are talking about. It would be a good idea if you could at least somebody would bother to write you a letter or call you on the telephone. How would you—how would you suggest that you would address the problem as being able—of your being able to find out when property becomes available and that kind of thing before some speculator has——

Mayor MYRICK. Well, very simply, if an arrangement could be worked out with the railroad so they would just give us, in other words, first right of refusal on any particular piece that was pertinent to what could be a major part of our transportation system for the future.

Mr. VALENTINE. Could you work it out the next time that you considered an increase in the ad valorem taxes?

Mayor MYRICK. Well, we also—you know, that is one thing, when you mentioned the North Carolina Railroad—we also want to work very closely with them when they do renegotiate their leases with particular firms because it would give us an opportunity to say, "May we have right-of-way usage for light rail on this particular line?"—you know, that is another way that we hope to be able to work that out.

Mr. VALENTINE. And, it would seem that they would not need as much of that property as they thought they were going to need 100 years ago.

Mayor MYRICK. Right.

Mr. VALENTINE. Thank you, ma'am.

Mayor MYRICK. Thank you.

Mr. MINETA. We have gotten a lot of testimony about flexibility, and I am wondering if you have any fears about that flexibility issue of where the states might leverage against local government to make sure that more of that funding goes—might go away from transit programs and—because of the needs related to highway improvement.

Mayor MYRICK. I do not think today I would say that at all. I think—we have a very good—first of all—working relationship with the state DOT. They have been especially—especially generous and good in working with Charlotte in helping us meet our needs. And, I think the fact that the whole State has become much more aware now of transit needs and the rail—Governor Martin having brought the rail issue to the forefront a couple of years ago—I think has really helped. And of course, the highway bill does have—I mean, the new funding bill for transportation does have some money in it for rail. That is a first for North Carolina because we had not thought that way before. So, I think that there is a feeling now within our General Assembly and within the North Carolina DOT that this is a very important part of our future. I really do not have those fears relative to the flexibility in North Carolina. Of course, I cannot speak for other States.

Mr. MINETA. Well, thank you very much, Mayor Myrick, for your being here and participating in these hearings. I appreciate, given the fact that you have a plane to catch, that you have taken the time to stay this long.

Mayor MYRICK. Well, thanks for your consideration.

Mr. MINETA. Thank you very much.

At this time, I would like to call on Dorothy Sparrow, director of the Kerr Area Rural Transit System, Community Transportation Association of America; Robert J. Godding, director of transportation, Chapel Hill, North Carolina and president of the North Carolina Public Transportation Association; Wib Gulley, chairman of the board of directors of the Triangle Transit Authority; and Cheston "Chet" V. Mottershead, president of the Tri-County Industries.

Let us proceed, and Ms. Sparrow, if you would go ahead.

TESTIMONY OF DOROTHY SPARROW, DIRECTOR, KERR AREA RURAL TRANSIT SYSTEM, COMMUNITY TRANSPORTATION ASSOCIATION OF AMERICA, HENDERSON, NC; ROBERT J. GODDING, DIRECTOR OF TRANSPORTATION, CHAPEL HILL, NC, PRESIDENT, NORTH CAROLINA PUBLIC TRANSPORTATION ASSOCIATION, CHAPEL HILL, NC; WIB GULLEY, CHAIRMAN, BOARD OF DIRECTORS, TRIANGLE TRANSIT AUTHORITY, DURHAM, NC; CHESTON "CHET" V. MOTTERSHEAD, JR., PRESIDENT, TRI-COUNTY INDUSTRIES, ROCKY MOUNT, NC

Ms. SPARROW. Thank you, Mr. Mineta and Mr. Valentine, for the opportunity to be here today. And, my testimony represents a different sector than has been represented today. I want to speak on behalf of the rural people of our State.

The process of reauthorizing our Federal transit legislation via the Surface Transportation Act, and field hearings like this conducted by the subcommittee, gives us an excellent opportunity to reassess our existing policies and to respond to the changes that have occurred in our transportation needs since the last reauthorization. On behalf of Community Transportation Association of America, the North Carolina Public Transportation Association, of which I serve as secretary-treasurer, the Kerr Area Rural Transit System (KARTS), where I serve as executive director, and the rural people of our State, I am excited about the opportunity to emphasize our needs. I also greatly appreciate the opportunity to specify points I believe should be given higher priority.

To tell you a little bit about the program that I work for, KARTS, we are a coordinated public rural transit system that serves the citizens of a five-county area. The counties are Franklin, Granville, Person, Vance, and Warren, with a population of 160,000-plus. These five county governments formed a regional transportation authority to oversee and operate their public transit system. We contract with over 25 human service agencies, one of our community colleges, as well as serving the general public, who are all transportation needy. With a fleet of 40 vehicles, it requires driving nearly 800,000 miles a year to provide approximately 150,000 trips. While we are in a position to help many, there are still more that need our service. With the initiation of the JOBS Program, our capital needs will become inadequate to handle the

increase without Federal funding assistance. Without our transportation service, how and where will the social service agencies buy or secure transportation to meet the needs for the JOBS Program and help to remove these people from dependency on welfare?

Prior to the 1980's, there was little recognition that rural areas might have transit needs. Now, there is a growing awareness that the rural communities represent at least a third of all the people who can be considered transportation dependent because of their lack of access to adequate private transportation resources, such as a family automobile.

I am convinced that rural transportation needs are much greater than those of our urban brethren. Rural residents are often isolated to the point that public transportation is their only life line or link to even modest amenities. By modest, I refer to a hot meal once or twice a week, a means to seek medical assistance, buy meager groceries or to wash their clothes. A means to seek assistance from social service agencies, to receive training or education and even to receive dialysis to maintain their existence.

Enactment of the section 18 program clearly demonstrated that mobility needs are real and extensive in the rural areas. Provision of public transit outside urbanized areas has grown substantially in the last decade. Despite this dramatic growth, it is estimated that current transit service in rural areas is adequate to serve only about one-tenth of the basic transportation needs of an isolated and transit-dependent population.

Reauthorization of the Surface Transportation Act gives us all the opportunity to do something about this deficit. During the 1980's, our Federal partner has withdrawn its financial support, dwindling from 100 to 80 percent, and now, in many cases, to no operating assistance. And the reduction in administrative and capital assistance from 80 percent to 60 percent. While federal assistance has become less and/or stagnant, our costs are skyrocketing. For instance, fuel, capital acquisitions and even labor for repair and maintenance of our vehicles. Stiffer mobility requirements are creating an inability to keep up with capital needs.

During the reauthorization, please remember the high priority of the rural needs and the inadequacies of the funding ratio as it is now. The following points, in my opinion, should be included as you analyze and debate the many crucial issues which must be considered as you develop a new Federal surface transportation program.

One on my list is the inequity of distribution of Federal resources whereby less than 3 percent goes to rural and small urban, while in reality, a more equitable percentage should be proportionately closer to the actual rural/urban population split.

Second, I believe that rural isolation is more damaging that urban isolation since it is often impossible for the rural citizens to access medical services, jobs, and even to training and education.

The American Disabilities Act is third on my list. I feel that these impact costs are unfair and are unattainable. This 40-percent increase of the cost to every transit vehicle is an unnecessary requirement when our present percentage of mobility equipment meets the present needs with prior scheduling. Who will finance that additional cost?

And last, please consider more human service coordination. While KARTS does a good job in this area—as does most of North Carolina—this is not true in other States. The new Family Support Act, the JOBS Program and Head Start should be coordinated for maximum cost effectiveness.

I believe that a reauthorization of transit programs and Federal assistance that includes these elements listed above will give Federal transit investment the higher priority that events today demand and that our rural citizenship deserves.

I really appreciate your coming to North Carolina to hear our concerns, and I do not underestimate the enormity nor the difficulty of the task before you. I humbly ask that these issues I have raised be considered in your process of reauthorization.

On behalf of the Community Transportation Association of America, the North Carolina Public Transportation Association and myself, thank you for the opportunity to express my views. I will be happy to answer any questions you may have later.

Mr. MINETA. Thank you very much.

Mr. Godding.

[The prepared statement of Ms. Sparrow appears on p. 3364.]

Mr. GODDING. Congressman Mineta, Congressman Valentine. My name is Bob Godding. I am the director of transportation for the town of Chapel Hill in North Carolina. I am also currently the president of the North Carolina Public Transportation Association, the folks that brought you lunch a few minutes ago. Our membership includes 41 transportation operators—mostly public operators, but a few private operators in both rural and urban communities across the State. We appreciate the opportunity to present comments to you as you undertake the most serious task of reauthorizing the Surface Transportation Act.

Public transportation systems in North Carolina have been asked to play an expanded role in helping to solve some of our State's more serious transportation problems. In many of our rural and urban areas, we are, unfortunately, strangling on our own success. Increased demand and utilization of our services have exceeded our operating capacity. In Chapel Hill alone, we experienced a 16 percent increase in our ridership in the past year. Much of the growth has occurred in our rural areas; however, recent environmental reports show that several of our urban areas are not meeting minimum air quality standards. This, of course, has resulted from traffic congestion and our overwhelming reliance on private automobile. The urban public transportation operators will be pressured to help expand their services to help solve this problem.

This increase in demand has reduced the ability of available financial resources to deliver these needed services. We are seeing dramatic reductions in the availability of Federal capital and operating dollars to finance transportation programs. For capital programs in Chapel Hill, for example, our local match—matching share for capital grants has increased 100 percent over last year. This has been primarily due to the fact that we have run out of section 9 funds for capital. We have allocated all of our section 9 funds for operating requests across the State, and we are seeking a statewide section 3 grant—capital grant for both urban and rural communities here.

Likewise, our section 18 funding has been completely allocated. And at the moment, it is really resigned primarily to be used in administrative costs for these rural and smaller urban programs.

As we make a request for additional Federal financial assistance, we are quite sensitive to the fact that we at the local—that we also need to fight for a stronger involvement at the local level. We realize that our State efforts to finance public transportation services are not what would be expected for a State of the size and stature of North Carolina. And as a statewide association, we promise to work on all possible fronts to try to ensure that each responsible jurisdiction—Federal, State, and local, as well as the actual user of the public transportation services—share in the cost of these services.

We hope that as we proceed into the future, a reauthorized Surface Transportation Act will provide a reliable and predictable level of funding—one that represents a fair Federal share of meeting our citizens' public transportation needs.

Specifically, I ask that you consider the following:

The adoption of the increase in federal gasoline tax to provide additional public transportation funding. This would result not only in a reliable source of funding; but it would also stimulate the driving public to reconsider how efficiently they are using their cars. It could also relieve the current burden on the general fund—Federal general fund as a source of public transportation programs. I believe the American Public Transportation Association has proposed a 7-cent Federal gasoline tax increase that would finance approximately $12 billion annually for a public transportation program. I feel that that is a fair proposal which deserves serious consideration.

We ask that you eliminate the Federal tax policies that encourage auto use and discourage transit and private investment—private investment in transit capital. Several of these alternatives have been mentioned already.

We ask that you provide adequate funding to cover the costs of those federally mandated regulations—activities that we are being required to adhere to as a result of the adoption of Americans with Disabilities Act and the Clean Air Act. We have no problem making sure that our services are fully accessible to the handicapped community. But, we realize that this is going to be a significant cost, and we do not want to see our costs increase so much that we have to cut back services to balance our budget. That would not be the purpose of the legislation.

We ask that you continue to provide an adequate program of operating assistance for transportation systems of all size. But also, we are aware of the fact that this money needs to be spent wisely, and we suggest that you consider some methods of measuring productivity as you apply those funds.

The current situation in the Middle East dramatizes quite clearly the importance and magnitude of our domestic transportation problem. We really have squandered an opportunity over the past 16 years since the first oil crisis to take the steps that would really eliminate our dependence on imported oil. As a nation, we are addicted to oil. We have only 5 percent of the world's population, but consume 20 percent of the world's annual oil consumption. If there

is any question about whether our addiction to oil is truly more serious than our addiction to other illegal substances, like cocaine, you need only look at the fact that we have billions of dollars worth of military equipment and more than 100,000 troops stationed in the Middle East and not South America.

As I look at the situation in the Middle East and other events occurring around the world, I find some significant ironies. I was brought into the transportation industry as a result primarily of Federal policies. In the mid-1960's, like millions of other people, I was drafted into the Army. I was eventually trained as a transportation officer. I spent a year in Vietnam, like millions of others. When we were asked the reason why were being sent to Vietnam, we were told we were there to stem the tide of Communism. Well, we have been out of Vietnam for 15 years now, and Communism has not crept very far from Vietnam. As a matter of fact, as we look at the situations in Eastern Europe, we see that Communism is crumbling from within. I think this situation makes the lives that were lost in Vietnam even a larger waste than they appeared to be 15 years ago.

I wonder what our troops in the Middle East are going to think 20 years from now when they are asked why they have been sent to the Middle East. I hope that they do not have to look back and conclude that lives were lost and blood was shed because our Government followed the wrong policies. The lives of our most precious resource—our young men and women—are far more valuable than continuing the policies that encourage the irresponsible use of the private auto and our increased dependence on foreign oil. Although many steps must be taken to reduce the—this addiction and improve our public transportation system, certainly, we are going to do everything we can to help take those steps.

We thank you for—I thank you for the opportunity to speak to you, and I hope that you enjoy your visit to North Carolina.

Mr. MINETA. Thank you very much, Mr. Godding.

Mr. Gulley, Mr. Mayor.

[The prepared statement of Mr. Godding appears on p. 3262.]

Mr. GULLEY. Thank you, Mr. Mayor, Mr. Chairman, Congressman Valentine. I want to tell you all that it is a pleasure to be before you, but it is even a greater pleasure to have you all here with us, to make time with all that is asked of you to come down here and be here. It is very important to us. Thank you so much.

I am appearing before you in my capacity as chairman of the board of the Triangle Transit Authority. It is a relatively new body of government that has been created just last year. Two MPO's worked together to create a three-county public transportation agency within their area. We have begun our work to try to provide some strong, affordable public transportation program within our area of some 700,000 people.

We envision that the system that we will put in place will include several things, and I am sure you are familiar with all these options—ride sharing, bus service linking major cities with our airport and the Research Triangle Park, HOV lanes, some form of fixed guideway transit between major population/employment centers—those kinds of options.

Our transportation needs here arise, as is always the case, from the particular geographic, demographic characteristics of our area. And, let me talk about those for just a minute, if I can. As with some other areas of the country, we have experienced rapid population growth. I think that the reflection is that it is not just rapid population growth, but this is not a traditional urban center. It is not a city that has grown from a center out; but rather, several smaller communities that have literally grown together. A different kind of urban community, if you will. And with that have come several challenges that are not new, but are certainly immediately upon us.

One is an extremely rapid onset of traffic congestion—significant to major traffic congestion along major arteries. For example, the road that you may have ridden on, Interstate 40 that runs from Research Triangle Park to Raleigh, last year, was widened from four lanes to six lanes to better accommodate additional traffic. The studies that were done as that road was being built, however, indicated that within 5 years, the transportation on that road would be worse than it was before they started the improvement and additional lanes would have to be added within that short period of time.

We also have seen an extremely rapid deterioration of our air quality in this region. From a time 6 or 7 years ago when if you flew or if you lived here, it was not something anyone talked about. It was not a factor. To today, we are the—we are told, the 18th worst area in the United States, air pollution that is visible as you fly in this area in the terms of a brown cloud. I think that is compounded to some extent by our geographic region, which is not likely to dispel that pollution as well as some other parts of the country.

There is also the rapid appearance of a need to coordinate land use policies with a regional approach to transit. And, I am sure that—that this has been a part of your committee's thinking for a long time, Mr. Chairman and Congressman Valentine. But, we are just beginning to realize in this area that if you are going off in one direction at local government with your transportation policies, and you are going off in another direction with your land use policies, then you are setting yourself up for major problems—that those two have to go hand in hand and be tightly coordinated. The reason I think this has importance to your work, obviously, is that local governments continue to be the body of government that deals with land use. Basically, it is a local government issue, and that is where those decisions are made. And so, Federal transportation policy, I think, has to encourage local governments to tie their land use and transportation decisions together, and the Federal transportation policy has to then tie into the land use decisions that are being made locally.

In light of this, we ask your help and consideration for several factors in designing the Surface Transportation Act. I would note that UMTA does have a Suburban Mobility Initiatives program. But, in our judgment, it is a relatively minor program and must compete with other discretionary funding programs. And, there is no section in the Urban Mass Transportation Act that addresses the funding need of regional transportation programs such as ours.

We would recommend that your subcommittee give consideration to these points in the reauthorization process:

One, that regional, low-density urban areas are emerging across the Sunbelt from San Jose to Durham, if you will, to eastern North Carolina, indeed. That new Federal programs should anticipate and respond to that trend. That the regional transportation authority should specifically be encouraged and supported simply because a city-based or county-based transportation approaches will not work, we think. It is going to have to be regional because the problem is regional in nature.

Two, both the needs and solutions will vary. It—I think it is self-evident—and you have heard that before, but I want to stress that we think there needs to be a flexibility in the funding that is provided and opportunity for local decisions about how it is used. A block grant approach, we think, makes great sense with few categorical restrictions. Simply because the mix of transportation alternatives is going to vary. Some communities will find that ride sharing works better or HOV lanes is an important part of their mix. Other communities may decide that fixed guideway systems are an important part of their solution.

Third, the creative alternatives to reducing dependency on the single-occupant automobile must be encouraged. I do not want to repeat the remarks of Mr. Godding before me, but we concur on that. Transportation block grants, we feel, should both permit and encourage trade-offs between transit and traditional road building solutions. I recently had the opportunity to visit in Portland, Oregon. I think that the Portland, Oregon experience in just such a trade-off—just such a taking money that was originally committed toward the highway in doing some highway improvements, but also doing some rail improvements—is an example of that kind of flexibility and trade-offs that we have to have the ability to do here locally.

Fourth, I will just touch on this briefly, but the—and you have heard the point—but, the—it is incredible to us as we are dealing with this that we continue to provide a tax-based parking subsidy in the Internal Revenue Code for employers who give their employees free transportation. At the same time, for those employers who are far sighted enough to try and provide transit, public transit assistance to employees, there is a tax on it about $15 a month. It just does not make sense.

Fifth, we would ask you to look at providing incentives or rewards for joint public/private ventures in the area of transit. We think that makes sense in the kind of new urban environment that we have. Dense multiple-use environments require that kind of approach, and these things are being done, for example, in the metropolitan Washington, DC area and other parts of the country, and we would like to see that encouraged. We think it encourages efficient land use as well.

Sixth, we would ask that you review some of the Federal policies for their practical effect. We are struggling now with the section 13(c) requirements of the act as our authority tries to begin doing business. And, we certainly have no problem with the intent—the policy direction of that section. But, as it is practically put into

effect, it seems to provide difficulties beyond what perhaps was envisioned.

I want to mention that—beyond the scope of my immediate authority—that there is a concern that I have from my work with city government and from our community with the consideration for larger trailers on the highways—triple trailers is how I have heard them referred to, or I think what is conceived of as well as larger double trailers. Frankly, I believe that we can already run triple trailers and we can already run big doubles. But, we should be running them on the iron rail tracks that are provided to improving that system and not—for a variety of reasons—going towards a rubber tired approach there.

Finally, as I think is obvious, we—we know that we cannot get the job done at the local level without you. We have to have a strong Federal presence and a strong economic support to try and meet the challenge at the local level. We are willing to take on additional responsibility at the local level, I think it is fair to say, we are willing to do the best we can. But, we need you all there, particularly with your economic support, and I want to add our support to the consideration for a significant increase in the Federal gas tax on the order of 7 percent to get the Federal spending level up to an $11 to 12 billion year level.

It is funny, and I am sure, Mr. Chairman and Congressman, you all have noted this—in a time where, as we looked at public transportation and there is worry about raising the Federal tax on gasoline a penny—what kind of reaction would you get—or 2 cents. It could cause a ferocious backlash. And we have lived in the last month and 6 weeks in a time when we have seen the price of gasoline go up 20 and 30 cents a gallon. And, our people have, I think, by and large, accepted that, understanding the situation that required it.

I certainly think we could turn around and talk to our people about the need for a much smaller increase that is going to help us both be energy efficient in a way that we have not before, dealing with some of the implications in the Mideast situation. But, that is also going to allow us to have a lot better quality of life in this country. I think if we tie the specific government activities and improvements and the benefits to that, that the public, at least in this region, is ready to support that kind of initiative at the federal level.

Mr. Chairman, Congressman Valentine, thank you all so much for letting me be with you this afternoon.

Mr. MINETA. Thank you very much, Mr. Gulley.

Now, I would like to call on Chet Mottershead, president of Tri-County Industries.

[The prepared statement of Mr. Gulley appears on p. 3266.]

Mr. MOTTERSHEAD. Thank you very much for the opportunity to speak before this committee about my interests in rural transportation. What I would like to do is just reinforce primarily what Ms. Sparrow and Mr. Godding have talked about in terms of our rural need for transportation.

I am president of Tri-County Industries, which is a work-oriented rehabilitation center for disabled people in a five-county area. We

provide comprehensive rehabilitation, training, job placement for people with physical, mental, and emotional disabilities.

I am also chair of the local rural transportation system in a two-county area. I would like to paint a picture of what those characteristics are. Nash and Edgecombe Counties covers about 1,000 square miles; population of about 113,000; and it surrounds a town—a city of Rocky Mount, which is about 50,000. This past year, our rehabilitation center rehabilitated and helped over 500 people secure employment. Characteristic of those people are 70 percent are at the poverty level; 50 percent live with one parent or guardian; 25 percent have been institutionalized; and 40 percent have multiple disabilities. And, it is these kinds of people that really take advantage of and really need a strong urban transportation system.

In 1987, four human service agencies formed the private, nonprofit Nash Edgecombe Transportation Service, or NETS. And, we became the lead transportation agency. And the department of social services and local community college and Tri-County Industries are basically the dominating forces on that Board. But, there are also other users of that transportation system—a childcare center, a vocational rehabilitation, mental health, and local community action agency. Last year, our system operated 252 days. We traveled over 80,000 passenger trips covering over half a million miles at the cost of about $400,000.

Some benefits of this system have been the 16(B)(2) funds. Tri-County Industries, some 10 years ago, served 50 disabled people in the immediate area of Rocky Mount. Today, we serve over 200 people. We travel 50 miles to bring disabled people into our rehabilitation center and provide rehabilitation and, ultimately, employment opportunities. In the past, disabled and elderly people would sit on the front porch and have a family member there attending them, and their activity was little or nothing. Today, they have the opportunity of health care, education and rehabilitation services in our two-county area, and it is because of our transportation service that makes this available.

Some of the problems of the transportation system, which has been well documented here, is the fact that it just costs too much money to operate the transportation system. We are not receiving enough subsidy for the system. Constantly, our human service agencies complain. We have little or no money to foot the bill for the transportation system or to add new trainees or clients into our system. And, it is a classic example, I think, of the poor in the United States becoming poorer because of the lack of adequate transportation.

There has been some—there can be some solutions. There are some in the making. I think the passage of the Americans with Disability Act is a short-term problem, but a long-term solution. We appreciate very much the strong support that you gave to that act, Congressman Mineta, and the support that Congressman Valentine gave to that act. It is going to open up tremendous education and rehabilitation opportunities for disabled people, as well as employment opportunities for disabled people. There are many labor market studies that show that the traditional labor market is going to be filled by minorities, elderly people and disabled people.

And, these are the very people that need transportation so badly. If these people do not get the health and education and rehabilitation services, they will continue to be a tax drain. We now have the opportunity to provide these rehab services and employment opportunities, and will have tax users now becoming taxpayers.

Local systems like NETS in our two-county area need to be cognizant of maintenance problems. We need to put more effort on maintaining our vehicles. We need to put more emphasis on training our drivers so that they adequately use the vehicles. We need to have more transportation—more coordination between rural and urban TDPs. And we also need—as human service agencies—we need to expect disabled people and elderly people to maybe come to bus stops. We should not expect door-to-door kinds of transportation. We need to be part of the mainstream of society in that regard.

But, I think the Federal Government needs to recognize the need of funding the rural area. Section 18 subsidies are very, very small, and it is impossible for many local governments to be able to generate their share of section 18 funds—just an unreasonable share for local counties to be able to match. We also need an increase in 16(B)(2) funds. The price of equipment and vans are just soaring, and the amount of money that we are getting is staying stagnant.

We try very hard, and I think we have a good staff in our local human service agencies to provide quality service for disabled people and elderly people.

As an officer in the Marine Corps, I had the job of helping young men—young Marines—to do their job. I had the job of advocating for them and to give them a sense of purpose and fulfillment. As I look at my two experiences as a platoon commander and as a rehabilitation facility manager and we talk about the Middle East and we talk about transportation problems here today, I just am struck by the incongruity of this whole matter. Each day, our Federal Government spends, I am told, $41 billion to protect the oil fields in Operation Desert Shield. Transportation costs in our two-county area is something like $400,000.

The reason we are spending this money protecting oil fields is because we have no strong energy policy. We have forgotten or we have frittered away the possible solutions that were available in the 1970's. Just imagine the strong energy policy implemented 20 years ago and enhanced every year since then we could have had to eliminate or reduce transportation costs today. Think of the energy-efficient vehicles we could have today. Think of the alternative energy sources we could have today. That is the big solution to our transportation needs. And, I think we need to begin grappling with that today.

I thank you for the opportunity to briefly explain how we need Federal funds and a comprehensive policy to help not only rural, but all of our transportation needs. Thank you.

[The prepared statement of Mr. Mottershead appears on p. 3322.]

Mr. MINETA. Well, thank you very much, Mr. Mottershead.

Ms. Sparrow, I would like to ask relative to your testimony. As you referred to the cost of implementing the ADA bill as something—40 percent of the cost of each vehicle in your fleet. This seems very high to me, since I would assume that you are using

demand responsive service to provide most of your rural service, and this service does not require that each vehicle be accessible. Also, this high figure probably represents the purchase price of a wheelchair lift when a ramp is all that is required to meet the minimum requirements of the ADA, and I am wondering if you could clarify this for us.

Ms. SPARROW. Most of our service, sir, is door to door, and providing ramps in these very poor, poverty-stricken areas is almost impossible. I was referring strictly to equipping each vehicle in our fleet, the cost would entail to make them wheelchair accessible when—we are able to meet the requirements or the requests now to serve the handicapped population in our five-county area with the vehicles we have presently equipped with prior planning and scheduling.

Mr. MINETA. And roughly, how large a fleet would this amount to?

Ms. SPARROW. My fleet is 40 vehicles, sir. And out of the 40, I have seven that are wheelchair equipped.

Mr. MINETA. Now, in terms of ADA, though, it would not require any more than that, right? In terms of the additional cost, I am just wondering, again, where that implement—or what triggers that additional cost.

Ms. SPARROW. It was my understanding that the requirements that we have adhered to since the origination of KARTS in 1983 of 7 out of 25 or so vehicles be lift equipped that each vehicle would have to be lift equipped, and that was, perhaps, a misunderstanding on my part.

Mr. MINETA. And door to door—door-to-door service, that is not a requirement.

Mr. Godding, you support, as I do, the continuation of a Federal operating assistance program for transit systems. As you know, the President's fiscal year 1991 program has eliminated the roughly $870 million that is in there for the operating assistance to transit systems. And of course, he really was precise. He said that to do away with the transit operating assistance programs to those metropolitan areas in excess of 1 million in population. But in your testimony, you refer to "ensuring that the program encourages the productive use of public resources." I am wondering if you could elaborate for us on how you would structure an operating assistance program which would meet this test of ensuring that the program encourages the productive use of public resources.

Mr. GODDING. That is a tough question to answer, and I think the Federal Government has made some attempt at doing that by using the statistics from their annual Section 15 report and calculating passenger miles traveled as a basis for allocating some assistance for the larger urban areas. In smaller areas, we do not have that requirement. I guess, what I am—what I was getting at when I made that comment is that there is nothing worse, as far as what irks the general public, as to see buses that are operating on routes without anyone in them. I think that what needs to be done—and I do not have a specific formula to suggest to you—I think what needs to be done is a very careful audit of the services that are being provided to make sure that they are being provided efficiently. In situations where the demand is not there to support

bus routes in specific areas or bus routes at certain times, there are other para-transit alternatives that should be considered.

In Chapel Hill, for example, we use a share-ride taxi service under contract with a local carrier to serve neighborhoods that do not support fixed route transit service. We also use this same approach in evenings and weekends at times when we do not—we cannot support fixed route services. I think that needs to be done in many areas across the country because I think that even though most systems will tell you that there is high demand and they cannot keep up with it, there may be some components of their services that are not being used as efficiently as they could be, or that they are not using a more efficient approach to deliver that service.

Mr. MINETA. There has been, again, some testimony about whether or not flexibility means shifting of resources away from public transit programs to provide the funding resource for badly needed highway programs. I am wondering if any of you might comment on whether or not you fear that as an end result of what we keep calling flexibility. Any thought on that? And how do we—if that is a fear, how do we protect ourselves away from that fear?

Mr. GODDING. I have mixed feelings about the concept of flexibility, quite frankly. It is obvious in this country that the highway lobby—the interest behind putting asphalt and concrete down and continuing to use our automobiles is much, much larger than the public transportation interest, and I think it is going to be a difficult task for elected officials to sort out those pressures and decide how best to allocate block grant funds if that is the way that the program takes shape.

But, I realize that in many areas, some officials feel frustrated by the fact that they have reached the limit on the amount of money they have available for public transportation programs; yet, may have available highway programs, but do not really want, for some reason, these highways to be built. There are areas like that. And, they do not feel they have the flexibility to shift these resources to where they would like to spend them. So, it is a tough question; but I guess we will have to trust in the judgment of our elected officials in being able to make that decision.

Mr. MINETA. What about that.

Mr. GULLEY. Thank you. I wanted to first note, Mr. Chairman, that normally, I conclude my remarks in a situation like this by saying, "I look forward to your questions," but having heard some of the questions that have been given before this panel and then to this panel, the intelligence, the difficulty of responding to some of those questions, I did not conclude my remarks with wanting to look forward to that. I just wanted to make note of that.

However, let me say, I think from a North Carolina perspective, to move away from the trust fund fixed 90 percent/10 percent concept to a block grant program is something that I would welcome and we would welcome for two reasons. One is that—I say this, that I would want the advice of our leaders in Congress from this State and area to advise us on that. The needs for public alternatives are much stronger than the 10 percent funds would allow us, I think, in general. And then, from this State, as you know and as you have had heard, we receive such a tiny percentage of that

back. We have very little to lose on the public transit side here in this State from moving away from that system. I think that we have a great deal to gain.

And frankly, I would welcome the opportunity to have at the State level the dialog and discussion we would need to have about what our needs are and what is the best way to meet them so that we could try some innovative answers. Roads would have to be a part of that answer. But, I think it would allow us a chance to do some exciting mixed-use proposals. So frankly, I would look forward to that and welcome that as a healthy development.

Mr. MINETA. Let me ask whether or not all of you have programs to involve the private sector, either to encourage employees to use public transit, or maybe even to get the business community to help fund some of these local programs. Is anyone enlisting the——

Mr. MOTTERSHEAD. We have a lot of involvement of the private sector in our rehabilitation program and some of our local education programs. And it seems like we would be using those resources and those contacts to cut off our arms—cut off our noses to spite our face—to then go back to them and have them put it toward transportation. I think many—many local businesses see——

Mr. MINETA. Do you think, Chet, we are going to say, Yes, I am willing to help fund some of your programs on the rehab side and maybe even do some of the—what do you call that, job sharing or the job where you do work for companies? Do you do——

Mr. MOTTERSHEAD. That is part of our mission, right.

Mr. MINETA. Your rehab program.

Mr. MOTTERSHEAD. Is to do subcontract work for industries.

Mr. MINETA. Right.

Mr. MOTTERSHEAD. We have United Way and local government paying part of the cost of transportation. And businesses and individuals will write out a check for "x" number of dollars, and that transports one trainee for a month or a year. But, it is such nickel and dime stuff. It just seems that there—there needs to be a commitment on the part of government to make this work. Where we spend so much time going to the private sector in trying to keep our head above water in so many other areas that it would just—I would be very reluctant to do it in this situation.

Mr. MINETA. So, you think our job really, to be supportive of what you are trying to do of the training, et cetera, and job placement, is to keep the support on the transportation side?

Mr. MOTTERSHEAD. Yes, sir. Yes, sir. As was mentioned, JOBS is coming in. There is just—there is more and more opportunities for people to get jobs if they get the proper training and education. And we have got to get people to these human service centers—to these education centers to make it work so that they can become independent.

Mr. MINETA. Do you work with JTPC, who——

Ms. SPARROW. JTPA.

Mr. MINETA. JTPA——

Ms. SPARROW. We have contracted services for the JTPA program at least once or twice a year for the college quarters. Some of the agencies that we transport do rely on the private sector for assistance to buy transportation; however, we do not work directly with the private sector to aid in the transportation services. We

have offered subcontracting arrangements, and that has not been taken advantage of in our area. But, there is a great need out there, and there is a lot of people trying to direct our attention toward transportation, and we are getting there. We just need the continuity of financial assistance to maintain and to continue.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman.

I will be brief. I want to first of all make a comment. We, of course, are in a different part of the transportation and mobility problem in this Nation, and we are in a very, very difficult area. All of us want to be sure—or at least, most of us—want to be sure that everybody's needs are addressed insofar as we are humanly able to do that as humans, I suggest that we are considering improving situations now where we made no attempt to do anything about it just a few years ago. There are certain inherent problems that we have talked all around, but have not come face to face with.

First of all, the reason we build all these extra highways and we spend all the money for asphalt and that sort of thing is not, in my opinion, because of any sinister vested interest groups that are prevailing on Congress to do it. It is because the country is so large and we have a love affair with the automobile. And where public transportation is available to us, we do not use it. We cranked up the railroad business—Mayor Wib Gulley, from—you and I took the inaugural run from Raleigh to Durham to Charlotte. And even on the first run when it was free, the train was about half full. With the bus transportation in the country on the decline, is there a nationwide bus company now in operation?

My point is that almost every form of public transportation that I know of has to be subsidized by the taxpayers. Even the trains that run in the Northeast corridor where the concentration of population in the United States has to be subsidized by the Federal Government. And when it comes to providing mass transportation to people in Brooklyn or Philadelphia is one thing; but when it comes to providing—meeting the mass transportation needs of people who live in the density of two people every ten square miles, then, you know, you get into a real problem. And we try to address it and hope to be able to address it in a better way, but there are certain inherent things about it that just almost boggle the—stagger the imagination.

For example, in discharging the responsibility that you have, Chet, and that Mrs. Sparrow, do you make any distinction—I suppose not—whether a person voluntarily lives in isolation or cannot help himself? You know, if some old cat goes out here and decides he wants to live way off on a farm out in the boondocks, that is the way he wants to live and he can afford to do otherwise, is he entitled to have the Federal Government or State government provide transportation so he can come in town to a doctor, just—you know—is there a difference? Is there a legitimate difference between a person who cannot do any better and a person who is in a situation like that voluntarily?

Ms. SPARROW. I can speak for our system at KARTS. The agencies that we contract with has the eligibility criteria, and they do have to be needy, socio-economically, financially, medically. They

have to be disadvantaged to be able to be sponsored by their program. And on their eligibility, we transport them.

Mr. VALENTINE. And of course, wherever one or two are joined together, there is disagreement. Even you all do not agree that is what the Americans for Disabilities Act is a good indication right there of the trouble we had in Congress—the soul searching for that. The vast expenditure of public money upsetting a lot of routines to equip public transportation so that everybody, regardless of their situation, can travel.

When do you think, Chet, that that bill—that we will begin to—when that—time for that to be able to put back into the mainstream, so to speak, and make taxpaying citizens out of people that—before we adopted that legislation, would not have had that opportunity?

Mr. MOTTERSHEAD. Well, we are doing it already. I mean, our vehicles are equipped.

Mr. VALENTINE. No, I mean in the country—in the Nation. It is going to cost billions of dollars to accomplish it.

Mr. MOTTERSHEAD. Well, it is a—I do not have a time table.

Mr. VALENTINE. I know you do not.

Mr. MOTTERSHEAD. But, we are working with Hardee's Food System right now to help them be able to hire mentally retarded people and to change attitudes of employers to hire people with mobility impairments. So here, you have one of the largest fast food companies that—whose attitude has been changed—well, before ADA, but it certainly has been helped with the passage of ADA. When you see things like that, there are jobs that are going to be available for a lot of people. And, they are working very positively to implement what they see as their responsibility. And, it is not altruism; it is because the labor force was not there and they needed to look at alternative labor.

Mr. VALENTINE. Mayor Gulley, among your recommendations for issues for consideration are incentives for joint public/private ventures. Can you give us an example or two of what kind of incentives the Triangle Transit Authority would like to see incorporated into the new highway bill?

Mr. GULLEY. Thank you, Congressman, I will try. What I had in mind is that there might be available a higher Federal matching share or special set of funds that could be used when a public transportation authority put together a particular transit option that involved a significant private contribution private involvement.

I had the opportunity of visiting Vancouver, British Columbia this summer for the APTA conference there to see their system, which is a fixed guideway system with stations. And, the commercial development has gone right around those stations, and they were able to leverage private investment on the order of three to one or four to one, which helps them in terms of building a system and paying for it by working jointly with the business community there and the development community. And, I think those kinds of options are available to us here. And specifically, as we looked at the guideway systems could we invite private participation in paying for some of the costs of putting a system in place if the benefit—the development benefits around our stations, for example,

they would have been able to take advantage of—I think that kind of partnership opportunity is before us.

Congressman, if you will allow me, I think that you expressed well one of the real problems you all grappled with in terms of this Surface Transportation Act and the pushes and pulls. It seems to me that we built a large—made a massive commitment to highways in this country through the interstate system for several decades. And because the country is so large or for perhaps a large number of reasons—and I do not know which ones were most important--but, one of the interesting things to me is we are at a period where that system has largely been at least built and put in place. It needs to be maintained; but it has been built.

And it is not a post cold world war; but it is similar to that in that there is a more fluid situation now for our transportation needs and priorities in the country. And the question of how we would approach it—and my hope—my thought is that it would seem that our public policies should be driven by what makes the most sense for the country. Now, the limitations on that are, what will people put up with and how—is the American love of the automobile single passenger—I can go wherever I want whenever I want. There are certain parameters and factors we have to deal with. But, I think that public officials should lead the charge on our transportation priorities based upon what seems to make sense. And if you ask me, if you look at energy conservation what makes sense. It is a clear answer on that. If you look at the point of view of reducing our air and water pollution problems in the country, there is a clear answer as to what makes sense among our options and where we should put more priority and more funds. If you look at the—just at the perspective of all this, some areas—perhaps a number of areas where roads cannot continue to be the answer because we have about built out where we can.

I have friends that live in the central part of California, and I get information from them that leads me to believe that there is not much more—there are severe problems in transportation mobility, but roads—it is just not much of an answer——

Mr. VALENTINE. Excuse me, Wib, but let me——

Mr. GULLEY. Please.

Mr. VALENTINE. How do you get people to not drive cars? I mean, how do you get—how do you get people out of those automobiles that go anywhere they want to any time they want to? How do you go about doing that?

Mr. GULLEY. That is the tough question—the one that you always hope someone does not put to you. Let me see if I can wind answering that, if you will—my thought is this. If you first say to folks, "It is not that the public transportation alternatives have been subsidized and the other ones have not."

Let us look realistically at it. The single passenger automobile has been massively subsidized through public building of roads and all the other things that along with capital and maintenance both—capital and operating both. And let us compare those costs. And so first, we have got an apples and apples comparison. Both of them are heavily subsidized—publicly subsidized. In fact, I think, now, it has gotten so expensive to build roads and acquire right-of-

way, that it might be that roads, in many cases, are the more expensive alternative from a public subsidizing point of view.

The same thing that we do is we say—and I am thinking about our Amtrak experience, and I am not real wise about that—and folks here with us today and with your staff know more. But, I know that one of the problems with Amtrak in Durham after we rode that first day is—it is slow coming through. And the reason it is slow coming through and not on schedule and folks cannot depend upon it and use it is because it is waiting for the train to come down the east coast. It is also slow coming back because in North Carolina, there are a lot of local laws and local parameters when it comes through cities, that slow them down. Those kinds of things can be dealt with. But, it is going to take some focus on that.

And, if we do some of those things—if we get rid of the tax subsidy free parking and we—and we encourage through our tax program, if anything, transit alternatives and some small things, I think we are going to begin to allow people a chance to say, "Well, that is part of it—let me see—that is part of the answer."

The other part of the answer is in our bailiwick. If we can provide attractive coach buses that take you rapidly where you want to go in Research Triangle Park and back or can get you to the airport—and the airport right here is becoming a problem. Folks do not like to drive out there and you have got to figure some place to park. A lot of times, the parking place is filled and it costs money. If I can ride me a bus out there and ride it back—if we can put you a fixed guide rail—guideway rail system on there that is attractive and so forth and cost effective, then I think we stand at least a chance to get folks out of the automobiles.

Mr. VALENTINE. But, we do not even have a bus out there yet.

Mr. GULLEY. I know, and that is part of what we are committed to try and do.

Mr. VALENTINE. We do not even have a bus to Research Triangle Park.

Mr. GULLEY. That is exactly right, and that is part of why we felt it would be wise to create this authority and begin to plug some of those holes. And believe me, that is a part of the immediate agenda.

Congressman, I remember about 10 or 15 years ago before I was ever mixed up with any of this. It was a gentler, quieter time.

Mr. VALENTINE. "Mixed up" is a good way to put it.

Mr. GULLEY. That is right. You do not know what gets hold of you. But, somebody said, "The only thing that moves this country really to make major changes is a great crisis or a great disaster." I have a feeling in transportation, we are going to move towards more cost-effective, energy-effective public transportation ways of moving our people. But, I would like us to try and do as much of that as we can through sort of—before the great crisis or disaster hits us. And I am looking for ways to do that that do not require people to get out—I would not order people out of their automobiles and do not make them give them up, but, I think with some of the things we have talked about, we can move in that direction.

Sorry I have gone on so long.

Mr. VALENTINE. Well, I want to add my personal thanks for all that you all do and for the preparation and for coming here to share this information with us. Thank you.

Mr. MINETA. Well, let me join in thanking all of you for being here with us today. There is no question that the transportation aspect of it and trying to get this balance between the highway and transit needs—trying to get a balance between the differing parts of the country and trying to get a balance between rural and urban—and that is—that is what Tim is here to try and figure out.

Mr. VALENTINE. Yeah, we are going to work all that out next week.

Mr. MINETA. I was just asking Roger about this whole issue of the $15 on the transit passes. If we were to increase that to $60 and get rid of that cliff, it would cost the Treasury between $400 to 500 million a year. So, in our trying to explore with the Ways and Means Committee, is there any chance of moving a bill that is already there, which a number of us cosponsored, to see if we could get rid of that built-in incentive right now that is in our tax system that says, "Stay in your car." We do not see any interest in moving that. But right now, the name of the game is, "We do not want to lose a dollar of any revenues that are going to be coming into the Federal Government.

Mr. GULLEY. Congressman, if you taxed as an employee benefit the parking—you assign some fair market value to it and taxed it, is there a sense of what that would bring into the Treasury, and does that——

Mr. MINETA. Well, the Senator D'Amato, in terms of financing this transit piece, was saying, "Okay, let us put a surtax on luxury cars." This other one about saying, "Well, let us reverse it and bring money into the Treasury by taxing the equivalency value of that parking out there" probably would raise even much more of a hail storm.

Mr. GULLEY. Hue and cry.

Mr. MINETA. Sure. Well again, let me thank all of you for being here today and helping us. So again, I especially would like to thank Chet for all his work in helping us getting ADA passed. Thank you. I appreciate it very much.

I would like to now call on Paul Jones, the director of the Governor's Highway Safety Program, North Carolina Department of Transportation; Forrest M. Council, deputy director, Highway Safety Research Center, University of North Carolina at Chapel Hill.

Your statement is going to be made a part of the record, so if you would go ahead and proceed in your own fashion.

TESTIMONY OF PAUL JONES, DIRECTOR, GOVERNOR'S HIGHWAY SAFETY PROGRAM, NORTH CAROLINA DEPARTMENT OF TRANSPORTATION, RALEIGH, NC, AND FORREST M. COUNCIL, DEPUTY DIRECTOR, HIGHWAY SAFETY RESEARCH CENTER, UNIVERSITY OF NORTH CAROLINA AT CHAPEL HILL

Mr. JONES. Mr. Chairman and Mr. Valentine, my name is Paul Jones. I am director of Governor's highway safety program. I am also the Governor's highway safety representative for North Caroli-

na. My role in life is to plan and administer the State highway safety plan, which is the agency that handles the 402 program in North Carolina.

Mr. Valentine, I think it is appropriate that this hearing be held here in this area because in your district nearby in Chapel Hill at the University of North Carolina is the premier highway safety research organization, one of the premier organizations in the world. Dr. B.J. Campbell and his staff, represented here by Forrest Council today, are recognized as some of the leading experts in not only the country, but in the world in highway safety. Also, in your district is one of our showcase police departments over in Tarborough. The department over there has been extremely innovative in its development of programs and its use of funds that have been made available. And also in your district over in Wilson County, currently, the only sheriff department—we have a program with the Sheriff's Department in Wilson County. It is the only sheriff's department right now currently working on any kind of highway safety program with our office, and we are grateful for their interest and their efforts over there, and I thought you ought to know that.

Mr. Chairman, Mr. Valentine, despite—well, first of all, you have copies of my prepared remarks, and I will just try to touch on a couple of key points—work off of notes, if you will. Despite measurable progress in highway safety not only in this State and in the country, highway death, and injuries continue to be a major problem. In North Carolina, every day, we kill four people, we seriously injure 33 and we have roughly 500 crashes or traffic mishaps every day. If you run a score card, that is nearly 1,500 people killed in our state every year. Of 120,000 people who were injured, 13,000 of those suffer some kind of—type of disabling short-term or long-term disabling injury. And, we have recorded in the past year 189,000 crashes or mishaps.

Highway safety in our State, as it is in most states, has been losing ground every year. Even though the crashes are up and injuries are up, the program has shown to be cost effective. The system is working. In this State, most of us in Highway Safety talk about the three E's—enforcement, education and engineering. But, we have added a fourth to that. The fourth "E," we would call EMS because part of this highway safety effort has to recognize the importance of EMS. If we do not have a good EMS system, those folks who will continue to figure out a way to kill themselves or injure themselves on our roadways are going to need some kind of care. And in too many cases, it is critical care, and we are trying to recognize the need and work with EMS. We think we have an extremely good working relationship to recognize their needs and continue to support their efforts to build a good statewide trauma system.

The seed concept—the 402 program—was designed to be a seed money concept program where people are allowed to try new ideas to try to address the crash rate or the fatality rate or the injury rate in their particular communities. We have—if you will—I will refer you to page 3, line 40 in my prepared remarks. We are finding case after case where programs are being institutionalized. There may be variations of the ways those programs were institutionalized in a State or local entity; but the seed concept is work-

ing, and not only in North Carolina, but other parts of the country. And, I will refer you to the testimony.

This morning, the Governor talked about flexibility and others have talked about flexibility in transportation programs. I would make the same appeal to you. Highway Safety offices need to be given flexibility to conduct problem I.D. and manage their programs in a cost-effective manner. We have money that has been earmarked over the years. Most of that earmarking has been released. We continue to have a portion of the 402 program that is set aside strictly for speed enforcement on the 55/65 mile an hour roadways. We believe that some flexibility in that program allows Highway Safety offices to work with local communities—and this is where we seem to be having more of a problem. We have Interstate highways or primary/secondary roadways that have 45 mile an hour or 55 mile an hour limits that are from a statistical standpoint, and from a problem I.D. standpoint, are very serious problems. Because of the regulations that are placed on that $20 million pot of money at the Nation level, our hands are, for the most part, tied from being able to help, again, local communities to address the problem.

Giving flexibility does not mean that we would take any less—give any less attention to the priority areas in Highway Safety, specifically the alcohol problem, the drug of choice, the gateway drug, if you will. This is a priority in our Highway Safety Program, as it is in most, if not all, Highway Safety Programs in the country. And certainly, speed would continue to be a priority with us simply because the police reports that we review and the—through the DMV reports that we see—speed continues to be the—listed as the key to many crashes and fatalities and injuries that occur as a result of that.

I would encourage you, Mr. Chairman, and Mr. Valentine and other members of the committee to support and encourage states to pursue comprehensive programs and to work beyond the traditional boundaries of highway safety in the 402 program as we know it. To plan programs—I can give you a couple of specifics that are also referred to in the prepared remarks. We are currently working with a couple of medical centers in the state that are organizing in their communities—one in Charlotte and one at Pitt in Greenville—to organize community traffic safety programs, bringing in all elements of highway safety, but with the medical community taking the lead. The police are very much a part of those programs. We have not minimized our involvement with police departments. We have community traffic safety programs that we are working within Greensboro, in Kanapolis and Salisbury—a couple of other cities around the state.

My bottom line as far as highway safety is concerned, in this state and others, is—and I know it sounds a little bit unusual to come from someone working in a department of transportation—but highway safety is really a health problem. This has been referred to by Secretary Skinner and General Curry at NHTSA. It is a risk management problem. But the real bottom line, it is an economic problem for all of us. It is an economic problem from the standpoint of what we pay as ratepayers for insurance services, where insurance services do not kick in and pay the health benefits

of people who are killed or injured, the taxpayers have to kick in. And I think most of us know that a third of the taxpayer—a third of the population does not carry any type of health insurance. And in too many cases, where health insurance is available, people are seriously injured and the health insurance does not cover it. Again, back into the taxpayer's pocket.

If we look at the—look at this program as a health prevention program, if we can reduce the cost of three long—life-time head injury cases in our State—in our State alone—that is out of those 33 people that are injured each week—seriously injured each day in our state—on an average of about one of those is going to wind with some kind of lifetime, long-term health care as the result of a serious head injury. The National Head Injury Foundation tells us that the average lifetime care cost of one of those patients is $1.2 million per case. I can show you cases that are—after a series of years—are in the $4 to $8 million range. But, using the $1.2 million figure as a benchmark in this state, if we can reduce the number of serious lifetime care head injuries by three—by three—that same amount of money will build—that is, buy the right-of-way and build—1 mile of rural Interstate in our—in North Carolina. These three head injured patients, the same cost would maintain 66 miles of rural Interstate highways in North Carolina. So, this health problem is a serious drain on our economy. It is over—nationwide, it is over 1 billion a week, and we are all concerned about the billion or so that is being spent each month in Saudi Arabia. In relative terms, this is—this really is a very serious problem.

This is a case where prevention is much cheaper than the treatment, that is, highway safety. It is a prevention program. It is a program that is working, and I hope it has earned your support to at least maintain the current level of funding, recognizing that you have some very serious decisions to make within the next week or so.

Thank you very much for your time, and I will be happy to answer any questions after Mr. Council.

Mr. MINETA. Thank you, Mr. Jones.

Mr. Council.

[The prepared statement of Mr. Jones appears on p. 3280.]

Mr. COUNCIL. Thank you, Mr. Chairman, Congressman Valentine. I am the deputy director of the University of North Carolina Highway Safety Research Center. Our center was established by the Governor of North Carolina 20 years ago to evaluate State programs, conduct national research. We have also—we have conducted research for FHWA, National Highway Traffic Safety Administration and conducted a wide range of program implementation and evaluation efforts for our own Governor's Highway Safety Program.

First, I want to thank this subcommittee for your past support of safety and safety research. In my written remarks, I have tried to provide examples of what I see as a clear link between safety research and successful programs that reduce motor vehicle injury. I hope this information will encourage you to continue or even increase research funding in the face of the pressures to cut the budget, to maintain the roads, to increase capacity—basically, to do all those things that are more politically acceptable than safety.

However, it is only through safety research and program implementation that we can reduce what Mr. Jones referred to—the overwhelming health care costs and emotional costs related to motor vehicle injury. I note that at the current death rate, we estimate that by the year 2020, 80,000 people per year will be losing their lives on our highways.

I emphasize that highway safety is a health concern. Motor vehicle crashes currently result in 50,000 deaths a year, and in addition, another 1.8 million people are seriously injured on our highways.

Because the young are the ones that die most often in motor vehicle crashes, the societal economic loss per motor vehicle death is something like three times the loss from a cancer death and six times the loss from a cardiac—from cardiovascular diseases. Yet, the research budget for all injuries—not just motor vehicle injuries—but all injuries is only about 16 percent of the cancer research budget and 36 percent of the budget for cardiovascular disease. My point here is not that those should be cut, but that injury—the most significant contributor to economic loss—is receiving a disproportionately small part of the research funding pie, compared to these other health problems.

With respect to the overall safety research program, I feel that we have to have an integrated program with research on the driver of the vehicle, the roadway and, I add, local community-based programs. In my written remarks, I have outlined what I consider to be specific research needs in each of these areas, and I would be glad to answer any questions you have on those. These needs range from research concerning how to offset the influences of alcohol advertising when we are trying to reduce drunk driving to roadway research programs related to, say, low-cost guard rails on low-volume roads and to the effects of longer and larger trucks that has been raised today, to increased safety emphasis and a new area involving the intelligent vehicle highway system program.

With respect to local programs, I submit that 402 has been a success in North Carolina. This funding has made it possible for us to design trial programs based on research knowledge to implement these programs and to evaluate them for effectiveness. It has also allowed us to evaluate ongoing State efforts and to recommend modifications where those needed to be made. I have provided in my written remarks an example success story in North Carolina, which was a direct result, I feel, of such 402 process—the protection of our children in car safety seats. The bottom line of that success story is an increase in children protected from about 10 percent in 1980 to a current level of 85 to 90 percent. Approximately—as a result of this, approximately 300 children have been saved from serious injury or death, and over 100 community-based safety seat loaner programs are still operating, even though 402 matching funds to those programs was cut off—was ended in 1986. The point here being that the seed money continues to pay dividends to our citizens.

In my opinion, our 402 program works here because of good administrators who have either come in with safety knowledge or have been willing to learn quickly and the link between the Governor's Highway Safety Program and research and evaluation exper-

tise. We try to provide research-based information on possible successful programs and try to evaluate what is done. To me, such a linkage is a very—is very important to 402 success in any state.

In summary, I have mentioned in my written testimony a number of areas which I feel deserve safety research funds. I noted there—that there are also tremendous needs for roadway maintenance and construction and transit activities. I am certainly not trying to make this a battle between construction and maintenance needs and safety needs. I hope and trust that there will be enough money for all of these needs as all are essential to an integrated program. However, I must say that given my years of experience in safety research and in safety program implementation, I do feel that in times of short budgets, increased inflation and increasing pressure from the public to make these—to make their driving lives better immediately—there is the tendency to meet these immediate needs and demands, rather than the more nebulous long-term cost or future health care and emotional trauma. However, I submit that these long-term costs are the ones that will be most important to not only our current generation, but also to the generation that my child and yours belongs to. I realize I may be preaching to the choir in my remarks to you, but I hope that some of this information will help you carry this message to your fellow committee members and to the rest of Congress in the STAA budget deliberations.

I thank you for this opportunity.

[The prepared statement of Mr. Council appears on p. 3252.]

Mr. MINETA. Thank you very much, Mr. Council. That—in the current authorization, we are authorized to spend up to $126 million a year for safety programs. The problem is that we have been subjected to an obligational ceiling by the Appropriations Committee of roughly $115 million. And so, there is roughly—I suppose by the end of this fiscal year, we could say that roughly about fifty some million dollars have been withheld from safety programs over the last 5 years of this present authorization program.

First of all, Mr. Jones, on page 3, line 41, you refer to D&E enforcement teams. What is D&E?

Mr. JONES. Drug, alcohol and—DRE?

Mr. MINETA. I am sorry. D&E.

Mr. JONES. I do not have a copy in front of me. I am sorry.

Mr. MINETA. It says, "The North Carolina 402 funds were used from 1983 to 1986 to create a D&E enforcement team."

Mr. JONES. Drug and education.

Mr. MINETA. Drug and education.

In your testimony, you indicate the need for a national data center for the collection, analysis and dissemination of uniform accident, injury and fatality data. However, the subcommittee has received testimony from other Highway Safety organizations that indicates that State reporting, on which national data collection would be dependent, is incomplete and uneven. I am wondering if you could suggest ways in which States could improve their reporting procedures and how might they be encouraged to do so.

Mr. JONES. First of all, I think a standardization—some rule of standardization needs to be imposed. I think before many States can get into upgrading their data collecting systems, money is

going be very much—thank you—is going to be very much a factor. It is an expensive proposition if you are going to get into any kind of data collecting system.

As an example, we were instrumental in helping the State of North Carolina start a trauma registry program. One of the objectives there was to be able to identify the motor vehicle traumas that are going into our trauma centers and use that data to work up counter measure programs to be able to link with our traffic accident reports, to be able to link with our EMS run reports, to be able to eventually link with the medical database commission—four very large and cumbersome systems, but—in which a lot of money has been sunk over the years. I think that if States are given the resources and know that they are going to have more usable information at their disposable, I think that is going to be quite an incentive for them to participate and actively develop systems, work to link systems in their respective States.

I know that Mr. Council and the Highway Safety Research Center work with data all the time and have helped develop North Carolina's data collection system, and I would—I would defer to Mr. Council for his expertise on those kinds of things.

Mr. MINETA. Mr. Council.

Mr. COUNCIL. The comment Paul just made about standardization is a good one. I think any time you go in asking police to do something different, you had better have a good idea of how you are going to use the information. Many of the police records are captured for legal reasons, rather than highway safety reasons because that is why the systems were set up originally. And so, if you change things, you need—you do need to have some good idea of what variables you need to collect and so forth. I think this is difficult.

I have—there is—as you know, there is a move in NHTSA right now to try to have the States collect a limited number of standard variables. But, there is an upside to that in that they will all be standardized if every State collects. Then, the downside to that is, if States under increasing budget pressure decide this is all the variables they are going to collect because this is all the Federal Government requires, my fear is, we are going to lose some of the information that we have now. We have tried to—we have put together for FHWA's use some data systems from five different states, and we have probably worked with data systems from 20 different States. It is hard to get the same variables, but you can still get information out of the systems when they are different.

I am not as down on the quality of police reporting as some people are. I think in some States, it is not good. I know in—I think in North Carolina, we have some of the best. We have worked on it for years through the Governor's Highway Safety Program through police agencies, and we have checked it out versus hospital data, and our police officers seem to do a pretty good job. So, I am not as concerned as some of the people in other States are about the quality of the data.

Mr. MINETA. What about this question of flexibility? We have heard a lot about it. Are there categories within the safety program that we ought to collapse in terms of—into some kind of block grant funding, so to speak, rather than the categorical pro-

grams? And I ask that because we have gotten resistance when I suggested this, especially from Mothers Against Drunk Driving, who are afraid that they will lose specific programs that are being directed to alcohol and drugs, substance abuse.

Mr. COUNCIL. I, quite frankly, do not understand the resistance by Mothers Against Drunk Driving toward the proposal. Highway—alcohol programs—alcohol intervention programs, counter measures—will always be a priority. Highway safety offices are going to pick that as one of their top one or two—it is going to fall in that category of objectives. The fact of the matter, as it is right now, I cannot see how a highway safety office is going to change anything about the way it operates in enforcement, in education, with the alcohol programs.

Where—I think the concern is that alcohol—if we move more toward comprehensive programs—might get lost in the shuffle. But, if we are going to manage effective programs, alcohol has to be considered an integral component. Substance abuse has to be considered an integral component of a comprehensive highway safety or traffic safety or traffic injury prevention program in a community. To put all the eggs in one or two or maybe three baskets is to ignore the seriousness of some other areas in highway safety.

You can make the same case for EMS. I know that discussion has occurred, that we need to earmark money to go into EMS. We had that at one time. I think that you need to put some trust in the highway safety offices to be able to identify their problems and manage—this sounds like State's rights, and I do not apologize for that. But, you have got to give them the flexibility to identify their problems and manage the resources in the best way they can, considering that the resources have continued to decline over the years.

Mr. MINETA. Mr. Council, let me ask about the—going back to the standardization. What kind of performance and maintenance standards exist with regard to roadway safety features, such as pavement markings, guard rails and signs? There seem to be disparities among States with regard to highway safety performance standards, and I am wondering, in your opinion, should the Federal Government require the establishment of uniform national performance standards, as you were indicating a little earlier, as opposed to guidelines to overcome some of the disparities. You were talking about the reluctance of—whether these become variables or optional programs.

Mr. COUNCIL. My first reaction—it is a good question—and my first reaction to it is that I am not in favor of standards until we have some basis for setting the standards, so I am——

Mr. MINETA. Excuse me. You are saying standards only when we find out first what we are going to be using this for.

Mr. COUNCIL. And also how effective it is to do a certain thing. For example, a pavement marking program. You could have a standard that simply said we will remark pavements on certain level roads every "x" number of years. You know, you could have a standard that says that. On the other hand, until we find out that there is some deterioration in—a significant deterioration in the performance of that pavement edge marking in terms of crashes, I

am not sure I would set a standard. So, I am looking for the research to get there.

Mr. MINETA. Let me, at that point say, my concern is there is an aging population in this country.

Mr. COUNCIL. Yes.

Mr. MINETA. With an aging population, should be widening—should we be widening the painted stripe on the road? Should we be moving the signs on the highway that says exit 28 is a mile and a quarter—should we be—instead of having that 400 feet from the exit, should we have those things maybe a mile back so that the older folks are now going to be saying uh-oh, here comes exit 28+ or yes, there are wider lines here that delineate the lanes. I am wondering whether or not we should not be going to some kind of standard because of some other factors that may be driving us to do these things.

Mr. COUNCIL. Clearly, the movement—the aging population becoming a bigger part of the highway driving population is going to mean we have to look for things to change. I do not particularly want to make the 3M people or the road marking people mad. I have not yet—I also hate to be a researcher who is coming here and say we always need more research, but I must say that the edgeline studies, for example, that I have seen on wider edgelines versus nonedgelines—we do not have the data right now on how those affect the elderly population. At least, in my mind, that says we should go ahead and require 8-inch edgelines on every road or require certain changes in all of the signing that we have out there. I do think we need to find out, and I know there is some work going on within FHWA right now—at least some simulator-based work—to try to determine that.

I am not—I do not know every study that has been done. The edgeline area, I have read some of the studies in, and there are—it is a very mixed bag. In fact, I guess some of the best studies say that the wider edgelines do not have that much of an effect on the normal driving population. So, I am not sure we have the data yet that I would have to say go to a standard now. Now, it is clear that we do have to look. I mean, we are getting to older drivers, and they—those older drivers, I might mention, are at high risk, clearly, of dying when they are in a crash.

There is some research now that is fairly interesting that is beginning to show that maybe they are not at quite as heightened a risk of getting into a crash. You know, if you just look at fatal crashes, elderly drivers look bad. But, part of the reason they look very bad with respect to fatal crashes is they die more often than the younger population does, given they are in a crash. So, the question is to separate their frailty—their propensity to die, given they are in a crash, from their actual driving behaviors that get them in the crash. I think that is where we are headed—I think that is what we are doing now.

But, there is some interesting—I saw some Canadian research the other day, actually, when I was reading some things for this testimony, that indicated that at least at intersections, there is some evidence that their crash rate, if you take out their frailty, their crash rate is not elevated. So, we need to fix intersections, but not just for the elderly. We need to fix intersections for everyone.

So, I think we are just beginning to get a point of knowing how it is this elderly population is going to affect future accidents at certain locations.

Mr. MINETA. Are there a lot of these programs that we have in 402—as you indicated, the engineering that has to be more—where the emphasis has to be more on the engineering piece of it, rather than the education or the—or this new element you suggested, the EMS piece of it?

Mr. COUNCIL. We already have the ability to—if I am understanding you correct—your question correctly—we already have the ability to address the elderly driver issue. Certainly, with the little pot of money that is available on the FHWA side in our State, it is not even going to scratch the surface of the problem of signs, pavement markers. It is not going to touch the issue of inventory or maintenance standards or anything like that. The money does give us some—I am looking for the word—gives us a little bit of room to address, from a program and valuation standpoint, what might occur with these.

As an example, Secretary Harrelson ordered some select roadways in the state be marked with bigger and brighter signs because of his concern with the elderly driver, but also, the general population being able to see where they are going at night and with—what is it?—53 percent of the crashes occurring at night. It is certainly important for everybody to be able to get where they are going with a minimum of confusion, especially if you are a stranger in an area. And, that is something that is being addressed in this state.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman.

I want to begin by mentioning something one more time that I thought I would never bring up again because it is—I have talked about it so many times that to discuss it is rather demeaning, but it has to do with safety. I have talked to people in the highway department about it, and I had thought one time that I would see if I could not get myself elected Governor of North Carolina, go through all that trouble so that I could do something about this. But I decided that might be too much trouble and, indeed, might be impossible. You traveled—and this—I am going to mention some other things about safety, and some things, we cannot do much about; some things, I can—we can quarrel about when it is really the responsibility of politicians, not you gentlemen.

But you, along many sections of public highway in the state of North Carolina, beyond—I am talking about now four-lane, two-lanes in that direction and two lanes in this direction—there is the center line. There is—or the edgelines, whatever you call them over on this shoulder. There are these metal stakes. We used to call them angle irons. And they are there. I do not know who the state buys them from. Somebody must have a damn fine contract because on U.S. 64 going east toward Nash County, there is one of those stakes about every 100 feet, apparently, sticking up like that. It has a little reflector on it, some of them do. They make it difficult when the mowing machine comes along, he has got to raise up his—there is no need to have them there really because you got the line. Anybody can see where the road stops—should be able to.

They come along and mow the grass, and they bend them down. And this State is filled—the highways in this state are lined with tank traps. When they are cut back like this, they are in the ground. Some of them are down so low that they are obscured by the high grass. They will penetrate an automobile or a motorcycle, knock a guy off of it and go right through the front of a car, up under the hood and into the belly of a passenger.

Now that is a—is something that can be corrected. And I am going to watch and see if anything happens about it, and I do not know whether—probably, somebody will come back and say we put them there because the Federal Government made us do it. If so, tell us about that. But, I mean, that is just one of those little things. But, it is there. Look at it next time.

Mr. JONES. I think the appropriate people to address that concern are here somewhere in the audience today.

Mr. VALENTINE. Well, that one—that is one we can fix. Let me tell you some other ones. We talk about safety, and you guys do a great job. We talk about safety; yet, we suffer fuzz busters. We were talking about them—I am not going to get into that any more. You will all think I am a crusader, which I am not. But, I do—these things do worry me, and the frustrations build with the years. I mean, there is no sense—there is no reason why they—by executive order or some way that we cannot address—we are law abiding folks. We ought to know which side we are on. What the hell do we want to do, encourage people—help people find out where that cop is and slow down? Hog wash. Speed kills.

Triple trailers. There are probably folks here from the trucking industry. My God, those things ruin the edges of the highways. If you try to pass them, it is, per se, a safety disaster.

DUI's. This has something to do with my colleagues. Go into the courts in this state and see how many DUI cases have been continued from time to time to time to time—some over 2 years. That is where we ought to—the press ought to be raising hell and the executive branch and the courts about the failure to bring to justice people charged with driving under the influence.

You mentioned the drug of choice. I am not a teetotaler. I hope my mother is not here. But we talk about the drug of choice; yet, nobody seems to be—we launch drug programs and television, radio. Those are gifts that all of us gave to private enterprise. When we told WRAL that they could go on the air, channel 11, all of us gave them that franchise. So they are different from the newspaper. If you guys got enough money, you can open up a newspaper and start that next week. If you got enough money, you cannot go get you a television station. You got to go to the government, and they got to—all of us got to do that. Yet, they continue to pump into the parlors and homes of America people pouring out that frothy golden mead and advertising beer and wine. I do not have anything against that. Come 5:00—I should not say that.

But we do not need to teach people to use that stuff, and we ought to—there ought to be at least a crawler along there sometime that says, "The commodity which is advertised is an adult refreshment. It is an intoxicant. It is for use of those people who are over 21 years of age." But they do not want to do that. You never see anybody drinking the beer. You never see that guy—you see it

looks like it is associated with success, peace and all that is good in life and athletic prowess and virility. They never show that guy out the door when he drives home after he has three or four beers. I have three or four beers myself on occasion. And we talk about—we beat our chests and talk about highway safety and drugs of choice and what do we do? We could cut that out if we had the will—the political will to do it. The same thing on radio. We try to do it in Congress. You get screamed at from the advertising industry, all up and down the line.

And so, I think it is rather a shame. Some of these things, we can—you all do not have anything to do with. And, I appreciate you giving me a chance to get that off my chest, and I—you know, we talk about all the good things, and here are some things we can do and ought to do, but we have been unable to do.

But, fix those tank traps. Thank you.

Mr. MINETA. Well, Mr.—go ahead, Mr. Jones.

Mr. JONES. In conjunction with your remarks about fuzz busters, I share your passion against fuzz busters. But in one area—one area where you could help the States. A few years ago, Congress approved a pilot project in Kentucky allowing drone radars. A number of other states have petitioned to be able to conduct the same program. The problem seems to be hung up with the Federal Communications Commission, which is not ready to grant state authority to put drone radar units around their State. I think an appropriate call or comment in the right place might help shake that loose and be of some benefit to States who are trying to combat the fuzz busters.

Mr. VALENTINE. You know A.B. Swindell, would you mention that to him? We will write something.

Mr. JONES. Sure.

Mr. MINETA. Well, Mr. Jones and Mr. Council, thank you very, very much for your testimony today. And again, thanks a million for all of your work on the Governor's Safety Association programs.

Mr. JONES. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much.

At this time, I would like to call forward a panel made up of Frank E. Willis, highway division chairman, Associated General Contractors, chairman of the board, Willis Construction Company; Frederick R. Allen, executive director, North Carolina Aggregates Association; Clint M. Reese, executive vice president, North Carolina Cattlemen's Association and member of the executive committee of the North Carolina Highway Users Conference; and Jack Lanford, senior vice chairman, American Road and Transportation Builders Association and president of the Adams Construction Company.

Mr. Willis, why do you not go ahead and proceed first.

TESTIMONY OF FRANK E. WILLIS, HIGHWAY DIVISION CHAIRMAN, ASSOCIATED GENERAL CONTRACTORS, WILLIS CONSTRUCTION CO., CHAIRMAN OF THE BOARD, FLORENCE, SC; FREDERICK R. ALLEN, EXECUTIVE DIRECTOR, NORTH CAROLINA AGGREGATES ASSOCIATION, RALEIGH, NC; CLINT M. REESE, EXECUTIVE VICE PRESIDENT, NORTH CAROLINA CATTLEMEN'S ASSOCIATION, MEMBER, EXECUTIVE COMMITTEE, NORTH CAROLINA HIGHWAY USERS CONFERENCE, RALEIGH, NC; AND JACK LANFORD, SENIOR VICE CHAIRMAN, AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION, PRESIDENT, ADAMS CONSTRUCTION CO., ROANOKE, VA

Mr. WILLIS. Thank you, Chairman Mineta, Congressman Valentine. My name is Frank Willis of Willis Construction Company in Florence, South Carolina. Willis Construction Company is a small family held business engaged in highway construction. I am the past president of the Carolinas Associated General Contractors and current highway division chairman of the Associated General Contractors of America. Carolinas AGC represents more than 3,600 firms that perform more than 80 percent of the Carolinas construction of highways, bridges, commercial buildings, industrial, and municipal utility facilities. I am also serving as chairman of the board of the Road Information Program.

Carolinas AGC appreciates the opportunity to express our views on the major transportation issues facing this Nation. As the Nation's leading construction industry association, we are vitally concerned that we have an adequate investment in our Nation's surface transportation infrastructure to provide the continued foundation for economic prosperity and our international competitiveness. AGC applauds this Subcommittee for scheduling this regional hearing in the Carolinas and getting on with the important task of reauthorizing the Nation's highway and mass transit programs.

Recognizing that construction of the Interstate Highway System will be essentially complete in the early 1990's, America is at a crossroads with regard to our future transportation policy. In March 1989, the AGC adopted a series of policy recommendations relating to future surface transportation legislation.

AGC believes that transportation infrastructure is at the very heart of what makes this country thrive and prosper. Over the past 30 years, the gross national product of this country has grown over 1,000 percent—nearly double the increase of the previous 30-year period of our history. Several factors account for this growth. But one factor, highway development, stands head and shoulders above all the others. America has grown and prospered from the mobility provided by this Nation's highway transportation system in general and, specifically, the Interstate Highway System. A look at the role of our highway system in the economy of this country shows the magnitude of its effect on our current and our future economic development. Eighty-nine and one-half percent of all personal travel is on highways. Eighty-two percent of all freight revenues are carried on highways. Nearly every product manufactured or consumed in this country is—at least for a portion of its journey—from production to market, carried by truck. And 85 percent of America's workers commute to work by private vehicle.

38-253 O—91——102

Increasingly, communities around this country are recognizing the critical link between highways and economic development. Recently, North Carolina voted a multibillion-dollar road development program designed to support North Carolina's rapid economic development.

A central question facing Congress as it begins to develop its future surface transportation legislation is how to ensure adequate investment in the Nation's transportation infrastructure to meet both our current needs and our future demands for economic growth. We in AGC believe that this nation is seriously underinvesting in its transportation infrastructure at a tremendous cost to this Nation in lost productivity, jobs and international competitiveness. This Nation's transportation system is the arterial system by which the country's economic development is nurtured and supported. If the people of this country—both public officials and private citizens alike—continue to ignore the construction and rehabilitation of this Nation's highways, the congestion in the Nation's airports and airways, then our nation will pay many times over in lost economic opportunity now and in the future.

The most in-depth analysis of highway needs was performed in 1988 by the American Association of State Highway and Transportation Officials. In their report, "The Bottom Line—A Summary of Surface Transportation Investment Requirements," AASHTO identified annual capital investment needs by all levels of government of up to $58.5 billion between now and the year 2020. This compares with the current highway capital spending in 1987 of only $31 billion.

AGC applauds the work of AASHTO as part of the Transportation 2020 program, and we encourage the Congress to consider AASHTO's policy recommendations on future funding as a sound basis on which to begin to debate and build future legislation.

As the subcommittee considers the future surface transportation legislation, we believe there are a number of important concepts which are critical to the success of the surface transportation program in the future. The most critical is the user fee trust fund concept. The trust fund concept has long been recognized as a reliable and stable financial mechanism for infrastructure investment. Several key features are largely responsible for its success. First, it is user-fee financed. The Nation's highway transportation system is paid for only by the user. The more you use the system, the more you pay. Public support has remained strong for the highway program primarily because the public perceives that it receives a direct benefit from the money it pays in user fees. Another key aspect of the trust fund is that it provides a stable and reliable financing mechanism on which a successful major capital investment program must depend. AGC strongly recommends that Congress continue and strengthen the highway user fee finance trust fund.

We recommend that Congress reject proposals to increase motor fuel taxes for deficit reduction or any other nontransportation spending. We support congressional efforts to increase funding for the Nation's highway system by spending down the trust fund balance, and we support elimination of the highway use tax exemption for gasohol and any other alternate fuel.

Both North Carolina and South Carolina continue to send more transportation dollars to Washington than is returned to our respective States. North Carolina ranks near dead last in the donor category. The current national highway program, through its maze of funding categories and antiquated distribution formulas, denies some of the most populous and fastest-growing States of a sufficient share of Federal funds to address highway needs. Carolinas AGC supports the minimum allocation to donor states and recommends that a more equitable variable be included in apportionment formulas that would address vehicle miles of travel, fuel consumption and miles of State system routes.

The budget problems which have faced this country since the late 1960s, however, have had a detrimental effect on the ability of the Federal Government to let the trust fund work in the manner in which it was intended. Since 1969, artificial spending restraints have caused the highway trust fund balance to grow dramatically to a current balance of over $15 billion, when you include the mass transit account.

A first step in addressing this issue would be to expend the trust fund balances for their intended purposes. Since the trust fund receipts can be used for no other purpose than transportation, bankrolling these trust funds is not only a breach of faith with the transportation users, but is merely postponing work that should be done now in order to prevent more costly repairs later.

A longer term solution to this same issue is, let us take the trust funds out of the unified budget. These programs have not contributed to the deficit. The cash balances are proof of that. The user fee financed transportation programs—the user fee has financed transportation programs of support. The receipts should not be loaned to other programs while our vital transportation needs are neglected.

AGC continues to endorse the House Public Works and Transportation Committee's initiatives to take the transportation trust funds out of the unified budget process.

In closing, AGC acknowledges that Congress faces a tremendous challenge in balancing priorities in the reauthorization of the post-interstate surface transportation legislation. Only when transportation is given top priority can we as a nation begin to address our transportation needs.

Thank you again for the opportunity to appear before you today.

Mr. MINETA. Thank you very much, Mr. Willis.

At this time, I would like to call Frederick R. Allen, executive director of Northern—I started to say Northern California, but—North Carolina Aggregates Association.

[The prepared statement of Mr. Willis appears on p. 3373.]

Mr. ALLEN. Chairman Mineta, Representative Valentine, and when he returns—Subcommittee staff—and other distinguished guests and attendees. Good afternoon and thank you for the opportunity to appear with you this afternoon to discuss our mutual concerns in transportation. My name is Fred Allen. I am executive director of the North Carolina Aggregates Association, the statewide industry trade association representing producers of crushed stone, sand and gravel.

Today, I speak to you as chairman of the Transportation Committee of the North Carolina Citizens for Business and Industry, a statewide trade association formed in 1942, and now pleased to count a membership of over 1,300 North Carolina employers from one-man professional firms to multimillion-dollar corporations, including financial and educational institutions, wholesale and retail establishments, manufacturers, construction and natural resource companies and many others. NCCBI is recognized as the U.S. Chamber of Commerce representative in North Carolina.

NCCBI's membership is acutely aware of the critical importance of transportation to the growth and economic strength of our State. The productivity and profitability of business and industry is dependent upon access to highways, railroads and, of course, to airports and deep water ports—all of which must be effectively connected to one another by an efficient surface transportation system.

The original program, of course, showed Mr. Tom Bradshaw as speaking to you, and I would like to acknowledge at this point that Tom is former Secretary of the North Carolina Department of Transportation and a member of the NCCBI Transportation Committee, was one of the principal authors of the just referenced 2020 report. Chairman Mineta, I am sure you are well acquainted with Tom Bradshaw. He was unable to be with us this afternoon.

I would like to focus this afternoon on the role which highways have played and must continue to play in regional business development. Primarily today, previous speakers have emphasized the movement of people. I would emphasize to us, let us not forget goods and services.

For some years, North Carolina has maintained a goal of encouraging regionally diverse industrial development. Jobs and improvements in our standard of living must be available to all citizens of North Carolina's 100 counties.

In 1988, NCCBI participated with the North Carolina Highways for Progress group in commissioning a study of the impact of highways on regional development. A copy of the study by the University of North Carolina at Charlotte and the Institute for Transportation Research and Education, entitled "Jobs, Highways and Regional Development in North Carolina" will be provided in follow-up testimony to you, Mr. Chairman and to the committee.

Let me quote three points contained in the Executive Summary of that report:

Number one, and I quote,

> The dispersion of jobs and industry that is characteristic of North Carolina, creates a strong pattern of commuting between counties. This flow is getting stronger, especially where workers are driving in greater numbers to jobs in the metropolitan centers. These commuters add to local traffic and create overloads that are clogging roads in the state's larger cities.

Quote number two,

> About 87 percent of the state's population and 90 percent of all jobs are found in nine broad economic regions. These functional regions represent a rural/urban partnership in which people can choose urban or rural lifestyles without foregoing access to jobs that are located in or near cities. An efficient highway network binds the various parts of our state together to the benefit of both urban and rural residents and businesses.

And number three,

With continued sound highway development, North Carolina is in a good position to take advantage of further growth opportunities around its metropolitan areas, while also doing this in such a way as to extend the benefits of economic growth to many of the rural parts of the state. Through this rural/urban partnership, a cherished rural/small town lifestyle can be protected without diminishing North Carolina's competitive position within the region and the nation.

I am advised by the North Carolina Department of Economic and Community Development—if you will, the State's department of commerce—that today and, in fact, since 1986, North Carolina has led the Nation in new manufacturing plants. And this could have only happened with a strong infrastructure program.

I would like to digress for just a moment, if I might, away from my prepared remarks to share with you a little bit of new information which I just received from the department of economic and community development. In speaking with them, they emphasized to me that virtually every industrial site selection team that visits North Carolina looking to locate a plant or manufacturing operation here asks among the top questions, what is our transportation system like? We, of course, are blessed with basically four Interstate highways. We have two deep water ports and two regional airports. Of course, as I mentioned, all connected by a strong highway program. This is critical, I think, to the selection of North Carolina for economic expansion and critical to the continued growth of our State.

Since 1986—I would emphasize again—North Carolina has led the Nation in major new plants—a major plant being defined as one with $1 million capital investment, 20,000 square feet of space and 50 jobs. In fact, in 1989, 105 such plants located in North Carolina. And by and large, these plants are asking to be 10 to 20 miles within an Interstate System. Again, the emphasis here is they must have adequate transportation.

Also, let me point out that an organization in Chicago that does annual surveys of economic development, called Grant, Thornton—they are accountants—and ranks manufacturing climates in the States every year. And just last month, in August—mid-August, they released a report which ranks the 50 States according to attractiveness of their manufacturing business climates. And I would quote from their findings. We are classed, by the way, as a high manufacturing intensity State. "This year, 29 States are classified as having a high intensity of manufacturing. The state with the most favorable manufacturing climate in this group is North Carolina, followed respectively by Vermont, Wisconsin, Mississippi, and Alabama." Mr. Chairman, I have got to believe that the climate—the very healthy climate in North Carolina for economic growth and expansion—is greatly due to a strong highway system.

While North Carolina, as you have heard several times today, has indeed, taken steps to provide what I would call these corridors to economic growth, we cannot do it alone. Continued federal appropriations from federal fuel tax revenues are essential.

The North Carolina Citizens for Business and Industry Transportation Committee recently adopted two positions relating to the Federal highway program:

Number 1, "To support timely reauthorization of the Federal Surface Transportation Assistance Act to include (a) a program to address the need for equity in the apportionment of federal funds and (b) to include provisions to provide greater flexibility in the categories and uses to which a state can apply the funds."

On the matter of equity, North Carolina has been the number one donor State, as you have already heard, for the past 20 years. It is time to correct this inequity and provide North Carolina its fair share of gas tax revenues.

NCCBI's Transportation Committee's second position was to oppose any program to use Federal motor fuel tax revenues for deficit reduction.

NCCBI supports the user concept fee of highway funding, whereby motor fuel taxes are dedicated for highway purposes. Further, on this point, we believe that the current $11 to 12 billion in the highway trust fund should be spent down over time for the purposes for which the funds were collected, that is, highway improvements.

NCCBI joins with the North Carolina Department of Transportation in opposing any Federal gas tax increase, unless it is combined with a spend down and with a program to bring equity to the appropriations process.

Also somewhat related and certainly discussed earlier today, the NCCBI Transportation Committee adopted a resolution in support of the planning of intermodal public transportation systems through the use of regional transportation authorities and encouraging public/private ventures and considering environmental concerns.

Mr. Chairman, members of the Committee, I am honored to have this chance to present these thoughts to you. We welcome further opportunities to work with you and the Subcommittee members as you prepare this vital legislation forming the future of our highway programs. Thank you very much.

Mr. MINETA. Mr. Allen, thank you very much.

Mr. Reese.

[The prepared statement of Mr. Allen appears on p. 3243.]

Mr. REESE. Thank you, Mr. Chairman, Congressman Valentine. My name is Clint Reese, and I am the executive vice president of the North Carolina Cattleman's Association, and I also serve as a member of the executive committee of the North Carolina Highway Users' Conference, which I am representing here today.

The Highway Users' organization is composed of some 49 State associations and companies operating in the private sector with a wide range of interest in matters which affect or influence the cost and quality of highway transportation. A current list of this membership is attached to your copy of this testimony.

Due to the understandable time constraints, I will only highlight the main points of my written testimony, which has already been submitted.

The Federal highway trust fund is a source of finances for the Federal Government's contribution to the national highway systems. The revenue for this fund comes from certain special and selective taxes which are levied on taxpayers solely because of their use and ownership of motor vehicles that operate on the public

highways. Their payment of these taxes are in addition to all the other taxes as any citizen would pay.

Because these are special and selective taxes, we strongly believe that they should be used only for improvement to the State and Federal highway programs. They are not the proper revenue for sources for general tax needs.

It is obvious that the Federal Government has an important role to play in helping assure that our national highway transportation needs are met.

We further recommend that the post 1991 Federal highway program be restructured to reflect the sound fiscal system and fair tax structure upon which the 1956 act was originally based. In order to accomplish this, we recommend the following changes:

First, the Federal highway program should be removed from the unified budget. This would help prevent the use of the highway trust fund revenues to help balance the Federal budget.

Second, the current provision which takes 1 cent of the Federal motor fuel tax for mass transit should be eliminated.

Third, the current balance on the highway trust fund, estimated to be about $17 billion, should be drawn down to levels which are within the boundaries of accepted accounting principles.

The Governor and the General Assembly of North Carolina recently recognized the importance of highway transportation by passing one of the most comprehensive highway programs in the State's history. They recognized that the State's economy and its quality of life are directly related to the quality of our highway system. The better the roads, the more quickly and economically we can move goods and services on which our citizens and business depend and which affects our competitiveness in the world marketplace. To keep this vision from fading, we are looking to the U.S. Congress to put forth a Federal highway program for the 21st century which will assure us a continuation of an affordable, efficient highway transportation program which will meet our State's growing needs.

Thank you very much.

Mr. MINETA. Thank you very much, Mr. Reese.

Mr. Lanford.

[The prepared statement of Mr. Reese appears on p. 3343.]

Mr. LANFORD. Good afternoon, Mr. Chairman and Mr. Valentine. I am Jack Lanford, president of Adams Construction Company, which is based in Roanoke, Virginia. I am pleased to present testimony today before the Subcommittee on Surface Transportation on the transportation needs of this Nation.

I am here on behalf of the Virginia Road & Transportation Builders Association, where I am a past president. VRTBA has been providing representation for the transportation construction industry since 1943. VRTBA is affiliated nationally with the American Road & Transportation Builders Association, where I currently serve as senior vice chairman.

Mr. Chairman, on behalf of our membership, thank you for allowing VRTBA to provide our views on future transportation needs. Road and highway construction and improvements ranked as the third most important issue to State legislatures and their staff behind tourism and agricultural environment.

At the outset, I will say that we believe that the financial decisions that the U.S. Congress makes next year in the transportation area will have a direct impact on the Nation's economy and well-being long into the future. But first, we must ensure that the Federal highway user fees are not raised for nontransportation purposes, including to help balance the Federal budget. The highway trust fund, along with the Federal gasoline and diesel excise tax was established to solely fund the construction and repair of our highway and bridge system. Diverting these funds would severely impact the ability of Federal and State Governments to meet identified infrastructure needs.

America is built on mobility. Its vast size places a high value on the ability to move people and goods over both short and long distances in an economical and efficient manner. The American highway system, developed jointly by the Federal and State Governments, has had more to do with our quality of life and economic prosperity than any other single factor.

The efficiency of our highway system also has a direct effect on productivity. It is a documented fact that countries that sustain a high level of public investment relative to output experience highway productivity growth.

During the past two decades, Japan has invested about 5 percent of its output in public works and achieved an annual productivity growth of over 3 percent. The West German experience is similar.

The United States, meanwhile, has maintained a low public investment ratio of three-tenths of 1 percent and seen inferior productivity growth just six-tenths of 1 percent per year. The fact is, the United States ranks 55th in the world in general—excuse me—in public capital investment. To me, that is a national embarrassment. It is also a sure prescription for economic decline.

Today, America's Federal highway system—the backbone of our national economy—is in serious trouble.

While this network of highways and bridges comprises only 22 percent of the Nation's total road mileage, it carries 81 percent of all travel—more than 1.6 trillion miles per year.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the Federal-aid system are either structurally deficient or functionally obsolete. The same report States that more than 40 percent of the pavements on the Federal-aid system are in poor or fair condition.

This 1989 report and the Federal Highway Administration's 1988 publication, "America's Challenge for Highway Transportation in the 21st Century", both State that meeting existing capital needs on the Federal-aid system alone requires a $40 billion per year investment in transportation construction projects—a rate of spending substantially in excess of the current obligations for the Federal-Aid Highway Program.

Meeting these quantified needs on the Federal-aid system is one of the major financial challenges facing the Nation. Failure to provide an adequate and usable highway system will have a profound effect on the quality of American life, our economic growth and development and our ability to meet national defense requirements.

The Federal-aid Highway Program has been a driving force behind building a better America. The reauthorization of this Fed-

eral program should foster continued opportunities for growth and development.

If the program's reauthorization legislation does not address known needs in a meaningful way, the deterioration of the Federal-aid Highway System, which is becoming more apparent every day, will continue, placing the American economy in danger. Today, highway disrepair and congestion are contributing to increased economic costs, air pollution and wasted energy resources.

According to Federal statistics, the Nation now wastes 1.25 billion hours and 1.38 billion gallons of motor fuels due to congestion on limited access highways each year. By the year 2005, that waste could soar to 6.9 billion hours in lost productivity and 7.32 billion gallons of squandered fuel.

Economists at the U.S. Department of Transportation estimate that if our highways are allowed to continue to deteriorate, by 1995, the U.S. economy could potentially miss out on increases of 3.2 percent in gross national product, 5.9 percent in disposable income, 2.2 percent in employment and 2.7 percent in manufacturing productivity.

Disinvestment caused much of our current problem. Total public capital expenditures for highways and bridges has dropped from 1.4 percent of GNP in the early 1960s to about 0.5 percent today. During this same period, traffic on the Federal-aid highway system has increased five fold.

What should be done? The solution to our highway problem is obvious: we must begin investing in the future. Providing adequate resources is the key.

One alternative is to spend the current cash balance in the highway account of the highway trust fund to address the call for greater highway improvement expenditures. But, how far will that $10 billion balance go?

An examination of the language of the Highway Revenue Act authorizing the highway trust fund shows that deficit spending in this fund is prohibited. Since the entire balance cannot be spent, the portion that is available, between $5 to $8 billion, will not significantly increase the current program.

The Virginia Road and Transportation Builders Association believes the Federal reauthorization bill should provide $40 billion per year for highway and bridge improvements. This authorization level should commence in 1992 and continue for a minimum of 5 fiscal years thereafter. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation referred to earlier in our testimony.

To authorize and carry out a program of this magnitude, we are recommending that the U.S. Congress:

Ensure that all Federal highway user fee revenue contributed to the highway trust fund—plus interest earned on that money—is spent in a timely manner. A drawdown in the trust fund's current $10 billion-plus cash balance should begin during the next fiscal year.

Remove the Federal-aid Highway Program from the Unified Federal Budget in order to ensure that revenues are not impounded or withheld in the future.

Increase the Federal highway user fees—effective in fiscal year 1992—to raise the additional $25 billion per year that is necessary for a $40 billion per year Federal program of highway improvement assistance.

No longer impose artificial obligation ceilings on the expenditure of Federal highway funds.

Repeal the current 6 cents per gallon Federal tax exemption on gasohol sales for highway vehicle usage, which causes an estimated $500 million per year loss to the highway trust fund; and

Tighten Federal highway motor fuels collection procedures.

These actions would assure that future generations have a highway system on which they can build. The historic role of the Federal Government in the development and upkeep of a national highway network should be maintained.

Recently, David Alan Aschauer, a senior economist with the Federal Reserve Bank of Chicago, and Richard Mudge, the former head of the Congressional Budget Office's Public Investment Unit, quantified the long-term national economic impacts of such a proposed program. Their findings are dramatic:

By the year 2012, national productivity would be 7.7 percent higher, resulting in an additional $400 billion per year in gross national product; and the expected productivity gain would generate an additional $29 billion per year in corporate profits and a $35 billion annual increase in private investment. That is an excellent return on your investment.

There is no question that the Federal Government has a clear role to play in the development and upkeep of a national system of highways and bridges. The Federal responsibility is defined by the constitutional mandates to regulate commerce among the States and with other nations, provide for the national defense and safeguard the public health.

The user fee principle that has guided the financing of our national highway transportation program has contributed to its success. Highway users recognize the importance of well-maintained highways and bridges. They also realize that continued expenditures must be made in order to maintain system performance at an acceptable level. Over the years, motorists have shown a willingness to pay appropriate user fees—if they are used for their intended purpose.

Consistent with our recommendation for increased funding, VRTBA also believes that the working partnership between the Federal Government and the States, which is the basis of the existing Federal-aid program, must be continued.

Some have suggested that State and local governments should be responsible for raising revenue to meet future needs for rebuilding and expanding our highway system. In fact over the last 20 years, Federal support for improvements has declined over 20 percent in constant dollars.

While the Federal interest has continued, State governments have worked to increase State revenues for highways to keep the system from further deterioration.

Now is the time to reestablish the true meaning of the Federal-aid highway partnership and to live up to the Federal commitment

to adequately fund improvements on highways and bridges significant in meeting transportation responsibilities.

The unwillingness of the Federal Government to raise and spend sufficient funds to maintain system performance has resulted in a program that is not fully meeting identified needs. Now is the time for bipartisan leadership in this area if we are to meet our future transportation demand.

America is literally at a crossroad. We can continue to ignore our serious and growing highway and bridge problems. Or, we can choose to make the investment—about $40 billion per year—that is necessary to rebuild and expand our national highway network to meet future demands.

Good roads save lives. Improve productivity. Enhance competitiveness. And reduce pollution-causing, energy-wasting traffic congestion. In short, they are an investment in the future.

Together, let us build a better America through transportation. The time to act is now.

Thank you for the opportunity to present the views of the Virginia Road & Transportation Builders Association on our future highway needs. I stand ready to answer any questions.

[The prepared statement of Mr. Lanford appears on p. 3290.]

Mr. MINETA. Thank you very much, Mr. Lanford.

Mr. Willis, the committee has been presented testimony supporting the use of Federal-aid highway funds for the construction of toll road facilities. What other creative funding resources are available for investment in our nation's transportation infrastructure?

Mr. WILLIS. What other creative——

Mr. MINETA. Funding sources, creative financing.

Mr. WILLIS. Do you want me to say public privatization?

Mr. MINETA. That may be a way.

Mr. WILLIS. It may be. I do not know that we have fully explored the ramifications of privatization of our highway systems yet to the extent that I would want to endorse that. When private enterprise begins to own something that is as vital to this country as our transportation system is, I think we need considerable more understanding and explanation of what those ramifications might be before we go too far in that direction, even though that the select opportunities, like the toll road at Dulles Airport, may very well be one of the practical applications of privatization. As in toll roads, that may be an answer in select opportunities or in select locations.

Mr. MINETA. Let me ask Mr. Lanford on that Virginia project. Do you think that is going to move forward?

Mr. LANFORD. Yes, sir; I think it is. I think it is on the verge of getting started, from what I have heard.

Mr. MINETA. One of the problems, as I understand it, with that one is that without eminent domain capability, it makes it tough to acquire the property. And one of the things that—I do not know whether it is done by accident or on purpose or whether that is—V DOT withheld—or the state legislature withheld the possibility of eminent domain powers being given to that private toll road corporation and whether or not that is going to really impair the ability of the corporation to really move forward on that.

Mr. LANFORD. Well, I am not directly familiar with it, but what I read in the paper, apparently, they had made arrangements to buy the right-of-way.

Mr. MINETA. Have they done that now?

Mr. LANFORD. I think they have the right-of-way in hand now. I think they are about ready to start construction, from what I understand.

Mr. MINETA. Also, in the AASHTO report that you have referenced, Mr. Willis, it provides for the establishment of a flexible urban program. And I am wondering, would AGC support greater flexibility for the use of Federal aid highway funds to meet urban mass transit capital needs?

Mr. WILLIS. Chairman Mineta, yes, AGC believes that there should be more flexibility in the selection of the projects to be funded by the authorizing State or local agency. We believe that there should not be so much flexibility in the return of the funds to the individual States. We would like to go back to a higher level of totalfunding. But, when you fund back to the State, let the State then have the flexibility of deciding where and how and to what project to apply those funds.

Mr. MINETA. The flexibility of course, from a—there has been some concern mentioned by the contractors in terms of whether or not there should be that flexibility on the transit side—moving to the transit side.

Mr. WILLIS. Well, I think within the AGC and within other contract organizations, a personal opinion of my own, that there are some mass transit projects—when you start talking mass transit—mass transit in North Carolina or South Carolina is quite different from mass transit in Boston or New York City. So, that the term mass transit begins to be a little bit misleading. Again, I can understand, as a contractor, and I think most contract organizations, including AGC, think in terms of mass transit as rail transit, as in the Boston Transit Authority.

On the other hand, in North Carolina and in South Carolina—if I may be specific to South Carolina for a moment, public transportation, which is, in terms, called—at times—called mass transit—public transportation in South Carolina enables a lot of people in some of our very poor rural counties—Williamsburg County, Georgetown County, some others that are close to our coastal areas—to transport people to our coastal areas to work in motels, hotels and our tourist industry. Tourist industry is our second largest industry in South Carolina. Mass transit enables us to put those people to work and take them off of the tax rolls. And that opportunity, they are using our highway system. It is very difficult, then, to oppose and does not make sense to oppose public transportation—mass transit, if you will—in that sense.

But on the other hand, if we are looking at a situation that begins to get to be a magnetic levitation mass transit situation, then yes sir, spending highway dollars for that does cause us some grave concerns—because of the magnitude of the dollars involved.

Mr. MINETA. Mr. Allen, the—we have been talking about how to get the public/private sector cooperation going—how to get more private sector involvement. I am wondering if you might have any

suggestions as to how we might enhance that private sector involvement in building our transportation infrastructure.

Mr. ALLEN. You are talking about, Mr. Chairman, in terms of a funding level or ideas?

Mr. MINETA. Both.

Mr. ALLEN. Well, I think these hearings, obviously, are well directed toward involving local government, local officials, local industry to hopefully develop some ideas about how we might involve greater public and private participation. I do not know that NCCBI—speaking specifically for that organization—we have not taken a position on a funding mechanism for public/private participation either in highway. I presume your question was directed either highways or so-called mass transit.

Mr. MINETA. Sure.

Mr. ALLEN. I do not know that I have any magic solutions for you. I think the project on Dulles Airport will be an interesting one to watch to see how that evolves. I think there are, if I recall reading—there are several others in this country. I think Denver, if I remember correctly, is exploring something. I think we need to carefully look at that. We need to look at the economics of that—things like you mentioned, the right-of-way acquisition. There is a lot of—lot of issues that may differ from State to State on how that is put together.

Mr. MINETA. Right. It is interesting that you say that the North Carolina Department of Economic and Community Development said that North Carolina today leads the nation in new manufacturing plants. So, that means that you are going to have to be doing—and already referred to what the commitment of the State is.

Mr. ALLEN. Right.

Mr. MINETA. What do you think has brought a lot of these plants here?

Mr. ALLEN. Well, reading the report that I referenced, the major thrust, obviously, is on available labor. Some would like to say low-cost labor, and there is some downside to that. A lot of folks think our labor rates are too low. Everybody gravitates to North Carolina. We could pursue that a little bit, the thing that I think in referencing that to highways is, one, yes, the labor is available. But, I would emphasize quality and trained labor.

As you may know, I do not think it has been brought up today that I have heard. We have a strong community college system in North Carolina with some 58 counties having a community college available to local citizens. This, I think—and these are structured, by and large, to the 2-year technology types of programs, and as the labor needs increase, these community colleges are—have been responsive to those technology needs, have been able to supply the labor that is needed.

I would emphasize again in terms of transportation that these community colleges, because of our transportation system, are accessible to the broad mass of North Carolina citizens so that an education is available. Hence, an entry into the job market; hence a labor pool for support of the industries coming to the state. I think it is geared around available access, if you will, to education and to the jobs.

Mr. MINETA. Mr. Reese, you are representing North Carolina Highway Users Conference, a very fine organization. We see Les Lamb, of course, in Washington, DC all the time. We have heard a lot about greater flexibility during the testimony before this subcommittee—not only here today, but in other hearings that we have held—the kind of flexibility between highway and transit programs. I am wondering if fuel taxes were increased in order to support a larger Federal program, do you think the Highway Users Conference would support a two-way transferability between highways and transit investments?

Mr. REESE. Well, as I pointed out, in North Carolina, we represent about 49 different organizations. I think you can visualize the problem that we have when you try to get 49 different organizations to agree on supporting certain programs. In this testimony today, I believe we were fortunate to get an agreement so that we could come up with, you know, what we testified on today.

Now, in order to answer your question, I would say that we would probably have to discuss that within the realms of those organizations. And to this point, I do not see that much flexibility in that organization.

Mr. MINETA. Mr. Lanford, mixing Federal-aid funds with toll financing is an option that, of course, is being considered to meet future highway construction needs, and I am wondering whether your organization would support greater use of toll financing.

Mr. LANFORD. Well, I think they might support the use of more toll financing. I am not sure they would support the concept of mixing. I am not sure how that would work out. I do not know if it has ever been absolutely discussed. Personally, I have a concern with tolls of any kind. If I read my Virginia history correctly, about 150 years ago, they worked really hard to get rid of toll roads in Virginia because they decided at that time that it impeded agricultural economy by having to stop at a toll gate every 2 or 3 miles and pay to get the produce to town. In a larger way, that is a consideration today because you are already paying one time when you bought the gasoline, and then, you have to pay the toll, too. So, my personal thought is that I would think seriously about toll roads. There are certain places where they are fine. The Dulles road is probably a good one. The Denver Bypass may be okay. It really is a bypass of Denver on the Interstate Highway System, though. And now you are going to start paying to go around it.

Mr. MINETA. Now, you were talking about a $40 billion program, as I recall, annually for highways and bridges. What does that translate into in terms of what would be needed in terms of a gasoline tax?

Mr. LANFORD. I think around 15 cents a gallon.

Mr. MINETA. Fifteen cents.

Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman. I do not have any questions. I want to just make a comment and thank this panel for your participation. It is very helpful your sharing these thoughts with us.

The comment is that—talking about this private entry—private enterprise into this sector in Virginia out at—toll road at the Dulles Airport. It is just not—it is not unheard of for governments

to vest the power of eminent domain in private corporations, do it all the time. The best example is public utilities. If they acquired all that property without the threat of eminent domain, I would think they paid a heck of a price for it. Maybe they did, but I do not see how they did. The people out there were well advised. You know, when you try to buy land for that kind of purpose, if they know that you cannot get it any other way, except to deal with me. It seems to me that would run the price of it through the sky. Thank you all very much.

Thank you, Mr. Chairman.

Mr. MINETA. Let me thank you very much for your presentation here today.

Now, I would like to call on Mr. Ed Harrison, Sierra Club, North Carolina Chapter and the Conservation Council of North Carolina. Mr. Harrison. Mr. Harrison, if you go ahead and proceed in your own fashion. Your statement will submitted—your full statement will be submitted for the record.

TESTIMONY OF ED HARRISON, SIERRA CLUB, NORTH CAROLINA CHAPTER, CONSERVATION COUNCIL OF NORTH CAROLINA, DURHAM, NC

Mr. HARRISON. Okay. Thank you. I wanted to thank Congressman Valentine and Congressman Mineta for giving citizens—particularly those in the environmental community in this part of America the chance to say our opinion on the future directions of surface transportation. I wanted, while I had the opportunity, to also thank the subcommittee staff and Congressman Valentine's staff for making it possible for me to get here.

I, myself, am a volunteer for the Sierra Club. Professionally, I am an environmental impact analyst, working on the effects of public sector development, such as roads on natural areas and surface waters and wetlands. Transportation planning is beginning to get on the edge of the envelope for me in terms of what I know about. But, I have put a great deal of thought into it and asked a lot of questions on my own in recent years.

And, more and more, we are finding that the 12,000 Sierra Club members in this State and several thousand other members of groups within the Conservation Council are learning about transportation as it is carried on in North Carolina, in the United States and raising more and more concerns. The Sierra Club, in particular, is getting known as the environmental group which is most active at the grassroots level of society, particularly at the cities and towns level. And a lot of our concerns have been developed locally and regionally. And, we can now bring local and regional concerns to you, our Nation's decisionmakers.

The Sierra Club has recognized the major role of transportation in determining environmental quality since the National Board of Directors adopted a policy on transportation in 1977. And, there have been some minor revisions since then. The facts have not changed since then. Our policy stands, and all that has changed in our end is that more and more members express more and more concerns daily.

The facts then and now are that transportation is a major environmental issue. Really, I am not coming here to bring you a lot of facts. I want to bring you that centralphilosophy. Now and then, it is the main consumer of our energy resources, especially petroleum. Transportation facilities dominate our patterns of land use. Motor vehicles are a major source of air pollution in urban and other areas, and we are told in North Carolina that they are the major source of air quality problems. And, motor vehicles are responsible for a significant amount of the run-off of oil and other toxic substances into the waters of the United States. And I use that term, "the waters of the United States" because under the Clean Water Act, all waters are public, and they are public resources.

Now, as in 1977, we see that our national transportation policies have major impact on our social environment, and we in the environmental community are concerned about that as well because we live in our communities. Past policies, we feel, have been a central factor in the decline of American cities. Inappropriate transportation technologies—the emphasis on cars above all—and discriminatory funding formulas have combined to create levels of pollution and congestion which have caused flight from our central cities. The resulting urban sprawl costs America heavily in the consumption of energy, and above all, land. And with land, as you know, they are not making any more of it, and oil is getting harder to come by all the time.

We contend now, as then, that Government policies have not yet paid sufficient attention to the need for energy conservation or the need to encourage transportation modes which pollute less and take less land. National policies continue to subsidize most the least efficient mode, highways for motor vehicles. According to the U.S. Conference of Mayors, Federal transportation funds have favored highways over transit by more than eight to one.

And I need to say, now, when I refer to transit, today, most speakers have been referring to rail and bus, for instance. The Sierra Club includes a number of other modes—bicycling, walking—however you can get around. When I lived in the middle of Durham, I got around, I would say everything, except a skateboard. In a central city, there are no ways that you can get around. As Congressman Valentine pointed out, North Carolina is so spread out that we generally do have to rely on cars. And, we do not feel that the—we feel that the urbanization in North Carolina—North Carolina, as you will see from the census, is now a majority of urban state. That this kind of thinking focused on the single-passenger automobile has got to change.

We see that, unfortunately, the economic advantage for asphalt and automobile is augmented at the State and local level. When local governments and the taxpayers provide free or abundant parking in business centers, the public loses the incentive to use transit instead of the single-occupant vehicle which are so common on our congested highways. And that—the matter of an incentive is really central. At the same time, over-abundant cars means that businesses and individuals pay the costs for health damage and lost work due to smog, for the damage to crops and buildings from smog and for the time lost in our lives to traffic jams. Now, the

solution has been offered in the last hour that the—the way that we solve this loss of time in our lives is to have more pavement to put cars on. Our solution is to address the disease, which is to have fewer cars on the road and to give the citizens of America a reason to have fewer cars on the road.

We believe in the Sierra Club and the Conservation Council that the State government in North Carolina has chosen the incorrect, short-sighted solution to congestion by foisting a $9-billion road building program on us without allowing a bond referendum vote. We see something on the order of a 13:1 ratio of highway funding to that for transit in this bond, and we see transit taking it on the chin. And, I think in the transit panel, you did hear something of that. For instance, this region's Triangle Transit Authority, as discussed by Mayor Gulley earlier, has not been yet worthy of State funding by our legislature.

Here in the rapidly growing Piedmont Crescent of North Carolina, which is pretty much from Raleigh to Charlotte and Winston-Salem, the environmental community is now seeing transportation priorities as a front-burner issue of public policy. And historically, we have arrived at this point because we grappled with issues of urban growth, land use and natural resource protection. Throughout the 1980s, the cities of the Piedmont put a great deal of effort, and that is the entire community—government, citizens, developers, all land users—into protecting surface water drinking supplies against damage from urban development. And, many of us came to realize that all our efforts in this regard were useless as long as our dominant patterns of surface transportation were unchanged. And my own examination of highway plans and programs shows that the five largest cities of central North Carolina each have interstate level highways or interstates crossing, planned to cross or proposed to cross the area closest to the city's water supply lakes. It appears that most of these highways yet to be constructed will be funded by the State's trust fund, but some could have had Federal funding as well if they are interstate. As we said earlier, motor vehicles put much toxic run-off into our waters. We also have air quality impacts, obviously, from automobiles. As Mayor Gulley mentioned, this Triangle region is now in the top 18 non-compliance regions of the country for certain air quality standards, carbon monoxide and ozone. And, we see also loss of our green breathing spaces around lakes and streams to road pavement as a threat to our public health. Overall, we cannot help to see transportation policies which subsidize highways over transit as a threat to the public health.

And, we have, as activists, moved from a local, regional concern with protecting drinking water and other natural resources to a statewide concern with disproportionate funding, and now have come to you, the Congress, for help in changing America's priorities. And I had to thank Congressman Valentine for telling us in our district newsletter this summer that the taxpayers of North Carolina receive a nickel in transit funding for every transportation dollar they put in. And every day, more of his constituents and other North Carolinians see the need for a change in that.

And every day, more of us here in North Carolina and America are speaking out about the connection that they see between the

crisis in the Middle East and the way we move ourselves at home. Our Nation's past transportation policies have resulted in patterns of vehicle and land use that consume two-thirds of our oil. And note, I include land use. Many of us hope that this is the last time that America needs to put lives on the line to protect oil supplies, to preserve an increasingly outmoded way of moving ourselves, the single-passenger automobile.

If the use of alternatives to the single-occupant vehicle is made easier and cheaper, then Americans will go with transit over cars. That is a key factor. As long as it is easier for governments to fund more and wider roads, instead of the transit alternative, Americans will not have the second option of transit. As long as highways come first, America will continue to generate the vicious cycle of sprawl, congestion, more roads, more cars and more sprawl, costing us energy, land and environmental quality. And on that vicious cycle, I would expect—I learned about it living on Long Island, and I think anyone—our Congressman from California will know it very well personally himself.

Our Sierra Club position here and nationally is that the major goal of transportation is to move people and goods, not cars and trucks. America's surface transportation program should focus on transit and other alternatives to the single-occupant vehicle, such as incentives to car pooling—high occupancy vehicle lanes. This transit focus should be combined with incentives for mixed use, infill land uses as a counter to urban sprawl. Our national goal should be to reduce the need for new roads and the need for further petroleum consumption.

To reform our transportation priorities, both decision makers and the public need a deeper understanding of the issues. And both here and in other hearings around the nation, we urge you to sponsor research to compare the relative impacts of highway to transit expansion, with transit expansion including infill developments on sprawl and traffic congestion; loss of forests, farms, et cetera; the consumption of energy and materials in construction; the consumption of energy and water in new developments; the production of air and water pollution; the condition of inner cities and their residents. If this were—if we were asking for an environmental impact statement on the entire state of transportation in North Carolina, this would be called secondary and cumulative impacts. And, we would ask that you sponsor research to evaluate all the present subsidies to motor vehicles. We have heard elected officials in this area say that we expect public transit to pay for itself. We find that we have to subsidize it, and why do not we ask the same of highways?

We ask you to adopt a surface transportation program that includes full pricing auto use—gas taxes, auto sales taxes, licensing and registration fees, smog fees, toll roads and elimination of subsidized parking—to recoup the full cost to American society of roads, cars and trucks. Now, toll roads are not something we have explored particularly in North Carolina yet, but I would have to say it is probably coming.

We also want a program that includes the use of these taxes and fees to build and operate adequate transit systems, with the remainder used to compensate State and local governments for their

auto-related costs to reduced sales and property taxes. We hope that incentives will be available to assure that transit funds are wisely used by requiring recipients to zone for compact, energy-efficient urban development.

As a spokesman for the environmental community on North Carolina's massive highway trust fund, I made some of these same requests last year to the North Carolina General Assembly. In particular, requiring that land use controls accompany highway construction. We are hoping for better from the U.S. Congress than another highway fund—just continuing the status quo. It is my hope that the Congress, which succeeded in an excellent reauthorization of the Clean Water Act, and which is approaching similar success on the Clean Air Act, will see that a reauthorized Surface Transportation Act can also have crucial environmental benefits for this Nation. To benefit all of us, it will have to move transportation in a new direction. And, the Sierra Club hopes that this statement and others you may hear in other places has told you how vitally important it is to change the way we move ourselves and the way we use energy and land.

I would like to add that through the environmental grapevine, certain national—what I would call transportation reform groups—have reached me in the last couple of days, including the American Railroad Association, concerning triple trailers. I believe Mayor Gulley also mentioned that. And, they have given me statistics which compare the relative pollution impact of the quantity of goods that we carry by triple trailers when they are carried on rails to when they are carried on highways. And those actual studies are actually done at Radian Environmental Corporation, which is 5 miles down the road here. And I also heard from Scenic America, your billboard control group, which I believe watches this committee. And they hope, as we do in North Carolina, that when new roads are built, and they will be, that there are requirements that have controls on billboard construction.

I am going to try to answer questions. As I said, I am more of an environmental impact analyst than transportation planner. But, I believe we can talk profitably.

[The prepared statement of Mr. Harrison appears on p. 3275.]

Mr. MINETA. Very well. Thank you very much, Mr. Harrison.

One of the things that we always want to do is talk about, for instance, alternative energy, and right now the law says that there is a gasohol exemption as far as the motor fuels tax is concerned. We have had some people say that we ought to be calling for the repeal of that because I think it costs about—that we get about $600 million less in revenues under the highway trust fund from that gasohol exemption.

But as we go towards trying to get to alternative energy sources—and I can understand from a transportation perspective the fact that an alternative fueled vehicle occupies the same space or weighs the same as a gasoline driven car, but we are losing revenue into the highway trust fund from that alternative energy vehicle.

I am wondering, is there some other incentive we could be using in order to get to alternative energy sources other than using the gasoline tax as the incentive to move from gasoline to whether it

be compressed natural gas or electric vehicles—is there some other incentive that you might have heard of?

Mr. HARRISON. I had not thought about it in terms of this piece of legislation. I had thought about it in terms of the Clean Air Act reauthorization, and not much at that. The main incentive I could see right now is regulatory. I hope the people have thought through this further, that noncompliant urban centers might have a different taxing situation, that maybe the exemption would be available for those areas but not for others. We have seen a situation, and I understand the situation is the same at the State level in California, that legislatures do not tend to be very good at changing regional tax structures, for instance having areas with different tax structures for gasoline or other fuels. And if there was a hand from above, say through the Clean Air Act reauthorization or even through this legislation as well, to make it that areas that demonstrate air quality problems would have an exemption but others not, that is what I would see.

Again, that is something that I have not—I am more a land planner and environmental analyst than a fuel analyst.

Mr. MINETA. Sure. This thing about full cost pricing of automobiles that you have brought up is a constant—is a subject that comes up quite a bit. The biggest problem I think we have with it is how to determine what is the full cost of the automobile to society. Do you know whether or not Sierra Club has done any studies on that subject?

Mr. HARRISON. I believe that the National Chairman of Transportation who lives in the Bay Area, is moving along on that. He has been cranking out a number of things, John Holtzclaw, and he spoke to I believe the Senate equivalent of this committee and gave some assistance to us out here. John would very likely be very happy to provide that information to you.

Mr. MINETA. I had forgotten that, I think he has testified.

Mr. HARRISON. I do not know if he has testified to this subcommittee or not, but I know that he has to a national committee.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Mr. Harrison, just a question or two. Do you not think you are a little bit tough on the automobile and highways? Let me put it to you this way, you are opposed—you and the Sierra Club oppose the expenditure, the raising gas tax in North Carolina to build more roads.

Mr. HARRISON. Actually, within the highway trust fund, since I wrote the statement on the highway trust fund, that was one thing we did support. Since we were lined up as opposition, it was considered that we opposed the entire fund. We did support the gas tax use for the trust fund because we thought it would encourage conservation and it turns out it apparently has.

Mr. VALENTINE. Well let me put the question to you this way, and I support almost every one, if not every single one of the goals of your organization. But I cannot, for the life of me, see how mass transportation, other than automotive, can function where population is spread out over a large area.

Mr. HARRISON. Well one thing we are asking for—and it is hard because local governments, particularly in North Carolina, control the land use, the State is just moving into that and the Federal

Government is actually a motivator behind the State doing that in some senses—as urban centers grow, we would like to see them grow based on transit lines with those lines receiving a fair and equitable portion of the funding, not a nickel for every dollar. And we are assuming that for one reason or another, highly productive farm land or watershed protection or whatever, there will continue to be large parts of North Carolina——

Mr. VALENTINE. I hope so too. I must have misunderstood something that you said. I am sorry, but I just got the impression that you did not think too much of the use of tax money for expanding the highways in the State, that you felt like that money could have been better spent in some other way.

Mr. HARRISON. No, I think you will be hearing more about that. I think we will be seeing a statement of the budget crunch, as a number of other States have right now, and the budget crunch does not seem to be quite so severe with the highway trust fund. But again, on the gas tax that was involved with that trust fund, we supported the gas tax, we saw it as a conservation measure. And it seems to have acted as one.

The goal, again, really is to find every incentive we can to have fewer cars on the road. And I think that is a lot of the reason that Mayor Gulley came out here today, someone that I have had the pleasure of working with in the past on these issues locally.

Mr. VALENTINE. Now that is a good point. How do we go about having fewer cars or trucks when the population is spread out like it is in North Carolina?

Mr. HARRISON. One thing that you look at is——

Mr. VALENTINE. Except for the fact that maybe every family does not need two cars and every child——

Mr. HARRISON. Something that we are seeing is that the number of cars in North Carolina is going up a lot faster than the number of people, and we are seeing that certainly in the Triangle area. Whether that is an economic factor or not, I am not sure, but that is apparently something we have noticed. And again, the easier it is for someone to get somewhere with two people in a car other than one, by having a high occupancy vehicle lane that allows them to move faster, then the more likely there are going to be two people in the car or three or four, than one.

We have a widening on Interstate 40 out here, it did not include a high occupancy vehicle lane. We hope that the next widening, which will probably happen before the end of the century, will include one. I want to note that there is a section in the 1987 Surface Transportation Act that requires that I-395, that money spent for it, that road in northern Fairfax County, be spent only in HOV. I do not think it will happen for this act, but I would hope that the 1997 act has something like that for Interstate 40 out here, for other roads in other parts of the country, that departments of transportation are not given the choice, that they really do have to put in HOV lanes which then serve as an undeniable incentive for people to use car-pooling.

So again, this is a broader reach than transit, this is everything, ride-sharing, wider outer lanes for bicycling which takes a few dollars here and there for, particularly college students. So there are a number of ways—sidewalks to allow people to get to bus stops.

They would not be taking the bus if they could drive to the bus stops, so we would like funding along those lines too.

Mr. VALENTINE. Thank you. Thank you, Mr. Chairman.

Mr. MINETA. Let me ask, do you think the Federal Government should be more involved in land use decisions at the local level?

Mr. HARRISON. We are starting—believe it or not, environmental groups do things step by step. We are starting with the state right now. It is not unknown that the Federal Government has looked at land-use control from that level. I would have to say the personality of the North Carolina resident is not one that takes very well to land use controls. I think that the federal role is more of supplying every incentive possible to have compact development.

Mr. MINETA. Maybe our role has been more inadvertent, whether it be through the highway program or——

Mr. HARRISON. That is exactly the case, yes.

Mr. MINETA [continuing]. Or let us say even HUD in terms of the FHA housing programs. We have been involved in land use planning, not directly, it is indirectly, but those kind of inadvertent policies maybe have more impact than what local governments do in land use control.

Mr. HARRISON. Well that is what we are saying, is that it is possible, using the federal funds to expand the transportation infrastructure so that you create sprawl——

Mr. MINETA. Maybe even in the Clean Water Act in terms of sewerage treatment plants, has contributed to that sprawl.

Mr. HARRISON. Yes, we believe that allowing grants to go out without making sure there were land use controls at the local level alongside them, we see that at the State level too, as generating urban sprawl. We have had the combination of the highway infrastructure spreading the the waste treatment infrastructure spreading all through North Carolina. I think north Raleigh is a fine example of that or a bad example of that, for our best local example.

Mr. MINETA. All right. Well thank you very much, Mr. Harrison, we appreciate your preparing the testimony and being before us today.

I would now like to call on Mr. Elbert L. Peters, president, North Carolina Trucking Association. Mr. Peters, we will submit your full statement for the record and if you would go ahead and proceed in your own fashion.

TESTIMONY OF ELBERT L. PETERS, PRESIDENT, NORTH CAROLINA TRUCKING ASSOCIATION

Mr. PETERS. Thank you, Mr. Chairman, Congressman Valentine, it is nice to be here today.

My statement will be very short as we have submitted a statement for the record, and I will attempt in a very brief manner to kind of summarize that.

My name is Elbert Peters, I am president of the North Carolina Trucking Association. Our association was founded in 1929 and we presently have a membership of 500 companies comprised of for-hire carriers and private carriers, both here in North Carolina and across the Nation. As you know, trucking does not necessarily confine itself to State lines.

I am privileged to speak today on behalf of these companies as they are truly the economic lifeline of our state. A look at some of the fundamental facts about the trucking industry in North Carolina will confirm the critical role in ensuring the continuation of the State's economic vitality. Based on 1988 data, the trucking transportation industry in North Carolina employs 214,395 persons; had a payroll in 1988 totaling over $3.9 billion; serves all of North Carolina's populated communities of which 69.5 percent depend entirely on trucks; paid $610 million in 1998 State and Federal highway taxes, accounting for 48.1 percent of the total State and Federal highway tax receipts paid by all motor vehicles, approximately $11.7 million each week; paid $382 million in State highway user taxes, 43.8 percent of the total paid for all motor vehicles.

At the national level, trucks are the carrier of choice of America's shippers. More than 77 percent of the value of everything America grows and produces now moves on trucks. Our industry generates fully 5 percent of this Nation's gross national product.

We support a new highway program that should contain six critical areas for your consideration.

First we think that the cornerstone of the program should be the preservation and reconstruction of the National System of Interstate and defense highway and all major primary highways of national concern.

In the area of program financing, we think that the $17.5 billion now in the trust fund should be used to start the new program. Only after the available funds are fully committed, should additional taxes be considered.

In the area of safety, we feel that the safety programs that have been funded over the years by the transportation—by trust fund moneys, have been effective. Noteworthy of these programs as they relate to the motor carrier industry is that of the motor carrier assistance program, which is a Federal/State partnership with activities designed to reduce commercial vehicle accidents. This program should be retained in the new act and possibly additional resources allotted to it.

Federal assistance for traffic engineering projects which are capacity and safety related should also be retained and enhanced with additional resources.

In the area of highway design, it is our feeling that we should build roads with a design to accommodate the maximum legal weight loads. According to many studies, this can be accomplished by adding a very small percentage cost increase to the specifications which are currently being used. In this regard, we are suggesting stronger and thicker pavement with better drainage base courses.

In the area of productivity, we here in North Carolina at this time do not feel that the LCVs would be appropriate. We feel that the thing that we need to do as far as productivity is concerned, is to improve the access routes to provide use of the vehicles which were authorized under the Surface Transportation Assistance Act. In many instances, this new legislation that we are talking about today may be needed to require States to provide better access for these vehicles as we relax standardization in that particular area.

In other related issues, in fiscal year 1992, we feel that there should be no less than $50 million dedicated to trucking related research. Safety, productivity and international competitiveness should be addressed in the research activities.

In conclusion, we urge the committee and Congress to base their decision on sound economic, engineering, demographic and business issues. Leave aside the politics when deciding these provisions to be included in the new Act.

My prepared statement has gone into more detail in each of these areas but that is what I would choose to say to you this evening as we close out this hearing.

[The prepared statement of Mr. Peters appears on p. 3336.]

Mr. MINETA. Thank you very much, Mr. Peters.

One of the things that you are calling for here is earmarking for trucking related research and development of $50 million. What kind of issues do you think ought to be receiving attention under that research program that you are suggesting?

Mr. PETERS. Vehicle design as much as anything, crashworthiness of vehicles.

Mr. MINETA. Crashworthiness, is that also including, what do you call it, alternative energy also for—for instance like we have an air quality control district in southern California that has now said that by 1997, they want all trucks to be methanol equipped rather than diesel.

Mr. PETERS. Well from what I know about alternative fuels, I suppose methanol might be the least desirable of all of them, particularly because of the burning characteristics of methanol. One step that has recently been taken as far as truck fuel is concerned is the fact that I think legislation was recently enacted which requires a clean diesel as opposed to the diesel, and that removes some of the sulfur content.

Mr. MINETA. I know in my talking to Detroit Diesel, Cummins, and Caterpillar, the three largest producers of diesel engines, when I asked them if they were doing anything on alternative fuels, they said yes, we are doing very little on alternative fuels but we are doing a lot on cleaning up the diesel.

Mr. PETERS. Yes; Detroit and Cummins and I suppose I would have to mention the other engine builders too, they have done a tremendous amount as far as increasing the miles per gallon, this sort of thing. And they are building engines now that should burn cleaner and also last longer.

Mr. MINETA. You also mention in here that interstate highways would be able to withstand eight times the truck traffic if they were 4 inches thicker than current standards. Should States get special incentives to build more durable pavements or should States be given mandates to adopt certain minimum construction standards?

Mr. PETERS. That is a tough question, Mr. Chairman. I suppose if we were to look at it from the standpoint of incentives, that there would be additional taxes connected with that, so I am not sure that I could advocate that for the industry at this point in time.

Mr. MINETA. Mr. Valentine.

Mr. VALENTINE. Mr. Peters, would—given your attitude which I do not disagree with about the place and position of private enter-

prise in our society, would not the question of research and development to improve trucks be better left to companies who manufacture trucks—would not the marketplace take care of that?

Mr. PETERS. As opposed to using government funds for research?

Mr. VALENTINE. Yes, sir. I mean, if it were an innovation like development of some new material or some new fuel, but if you are talking about what is necessary to make a better truck, with all the things the Federal Government has to do, do you really think they ought to be involved in that?

Mr. PETERS. I suppose as far as the product itself is concerned, perhaps you are correct. One of the areas of concern that we have always had as far as the research is concerned is that it appears that in many instances the research is done by organizations that are not really proponents of truck transportation and we sometimes wonder about the validity of that. I suppose that is one reason we included that in our testimony.

Mr. VALENTINE. How does the truck—the North Carolina Trucking Association feel about triple trailers in North Carolina?

Mr. PETERS. As you know, for many years we attempted to get twin trailers here and we were never successful in doing that and it was only as a result of the Surface Transportation Assistance Act that that happened. In talking with a number of my members who are domiciled here in North Carolina and local members, they feel that we are several years away from even thinking about that type of vehicle. We need to improve the access for the vehicles we now use, the 48-102's and the 53's and the 28-foot twins. The LCV situation, as we see it, is primarily a Western and Midwestern situation where they have the roads and the environment that is capable of handling that type of vehicle.

Mr. VALENTINE. Well it——

Mr. PETERS. We do not see that it would increase the productivity here in this particular area that much.

Mr. VALENTINE. But you do feel that in some places it would—they should be allowed to use them?

Mr. PETERS. Well they are already being used in——

Mr. VALENTINE. I understand that, but I was just thinking about your position as to whether or not you really think they ought to be used anywhere. I suppose the answer to that is obvious.

Mr. PETERS. Not at this time, not in North Carolina.

Mr. VALENTINE. Thank you, sir.

Mr. MINETA. Well Mr. Peters, thank you very, very much for your fine testimony and for your complete statement on behalf of the North Carolina Trucking Association. Thank you very much.

At this time, I would like to submit for the record the statement from Piedmont Triad Horizons and a statement from the Carolinas Transportation Compact.

Are representatives from these two organizations here? If they would like to make a brief statement on their behalf, they would be more than welcome to do so.

Sir, if you would identify yourself for the record, I would appreciate that very much.

[The prepared statement of Ms. Upchurch on behalf of Carolinas Transportation compact appears on p. 3267.]

TESTIMONY OF CHARLES FISHBURNE, MEMBER OF THE CITY-COUNTY PLANNING BOARD OF FORSYTH COUNTY AND WINSTON-SALEM, NC, AND MEMBER OF THE PIEDMONT TRIAD HORIZONS TRANSPORTATION COMMITTEE

Mr. FISHBURNE. Mr. Chairman, I am Charles Fishburne of Winston-Salem, representing the Piedmont Triad Horizons group which you heard something from the gentleman from Greensboro about awhile ago.

I will not read but the last portion of this report, if it is all right with you.

In the Piedmont Triad, which represents Winston-Salem, Greensboro and High Point, we have the opportunity by planning ahead to avoid the gridlock other regions have experienced. To do this successfully we will need the help of both State and Federal Governments. Citizens have worked for the last 2 or 3 years pursuing the possibilities for light rail transit and a regional transportation system.

In February 1988, the Forsyth County Planning Board established an ad hoc committee to explore the use of light rail.

In May 1988, this committee took the concept of light rail to Piedmont Triad Horizons. The two groups combined efforts so that one regional committee could pursue the use of light rail.

Piedmont Triad Horizons hosted a regional transportation conference on September 19, just last Wednesday. The purpose of the conference was to bring together elected officials, transportation staffs, and concerned citizens to hear the same information and to focus on securing an effective pubic transportation system for our region.

We can see a Triad rail system tying into a State system. In the Piedmont Triad, we have an abundance of existing rail routes. There are five major routes in Forsyth County and six in Guilford County.

What is needed now is a study to determine the feasibility of light rail use in the Triad region. For the future we are asking that the Federal Government give priority to the development of regional public transportation.

In conclusion, citizens in the North Carolina Piedmont Triad request that when recommendations are made for reauthorization of the post-interstate surface transportation programs, two concerns receive priority. Fair allocation of moneys and second, support of the development of regional public transportation systems.

I mentioned in the next to the last paragraph the feasibility of light rail in the Triad region. We would certainly want that to consider bus cooperation with the light rail system. We have seen what this has done out in San Joaquin Valley there with the Amtrak trains and the buses in cooperation and it has been great.

[The prepared statement of Mr. Fishburne appears on p. 3259.]

Mr. MINETA. Thank you very much, Mr. Fishburne.

Let me ask is Peggy Upchurch here or would you just like to have the statement submitted for the record.

[No response.]

Mr. MINETA. Okay, we will go ahead with unanimous consent, without objection, and include that last statement from the Carolinas Transportation Compact.

There being no further business before the subcommittee, the subcommittee stands adjourned, and I would like to thank everybody for their patience and attention and also to Mr. Valentine, to your staff, for the really outstanding job they did in helping us make all the arrangements here.

The subcommittee stands adjourned.

[Whereupon, at 5:25 p.m., the subcommittee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

TESTIMONY
to the
SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE
U.S. HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

September 21, 1990
Research Triangle Park, NC

by
Frederick R. Allen
Executive Director
North Carolina Aggregates Association
P. O. Box 30603
Raleigh, NC 27622
(919) 782-7055

Representing the
North Carolina Citizens for Business and Industry
Transportation Committee
P. O. Box 2508
Raleigh, NC 27602

(32 43)

Mr. Chairman, members of the Subcommittee, Congressional staff, other distinguished guests and attendees . . . my name is Fred Allen. I am Executive Director of the North Carolina Aggregates Association, a statewide industry trade association representing producers of crushed stone, sand and gravel.

Today, I speak to you as Chairman of the Transportation Committee of the North Carolina Citizens for Business and Industry, a statewide trade association, formed in 1942, and now pleased to count a membership of over 1,300 North Carolina employers from one-man professional firms to multi-million dollar corporations, including financial and educational institutions, wholesale and retail establishments, manufacturers, construction and natural resources companies and many others. NCCBI is recognized as the US Chamber of Commerce representative in North Carolina.

NCCBI's membership is acutely aware of the critical importance of transportation to the growth and economic strength of our state. The productivity and profitability of business and industry is dependent upon access to highways, railroads and, of course, to airports and deep-water ports . . . all of which must be effectively connected to one another by an efficient surface transportation system.

I would like to focus this afternoon on the role which highways have played and must continue to play in regional business development.

For some years, North Carolina has maintained a goal of encouraging regionally diverse industrial development. Jobs and improvements in our standard of living must be available to all citizens of North Carolina's 100 counties.

In 1988, NCCBI participated with the NC Highways for Progress group in commisioning a study of the impact of highways on regional development. A copy of the study by the University of North Carolina at Charlotte and the Institute for Transportation Research and Education (ITRE), entitled, "Jobs, Highways and Regional Development in North Carolina," will be provided in follow-up testimony to you, Mr. Chairman.

Let me quote three points contained in the Executive Summary:

- "The dispersion of jobs and industry that is characteristic of North Carolina creates a strong pattern of commuting between counties. This flow is getting stronger, especially where workers are driving in greater numbers to jobs in the metropolitan centers. These commuters add to local traffic and create overloads that are clogging roads in the state's larger cities.
- "About 87 percent of the state's population and 90 percent of all jobs are found in nine broad economic regions. Those functional regions represent a rural-urban partnership in which people can choose urban or rural lifestyles without foregoing access to jobs that are located in or near cities. An efficient highway network binds the various parts of our state together to the benefit of both urban and rural residents and businesses.
- "With continued sound highway development, North Carolina is in a good position to take advantage of further growth opportunities

"around its metropolitan areas while also doing this in such a way as to extend the benefits of economic growth to many of the rural parts of the state. Through this rural/urban partnership, a cherished rural/ small town lifestyle can be protected without diminishing North Carolina's competitive position within the region and the nation."

I'm advised by the NC Department of Economic and Community Development that, today, North Carolina leads the nation in new manufacturing plants, and this could only happen with a strong infrastructure program.

While North Carolina has taken steps to provide these *corridors to economic growth*, we cannot do it alone. Continued federal appropriations from federal fuel tax revenues are essential.

The NCCBI Transportation Committee recently adopted two positions relating to the federal highway program:

1) *"To support timely reauthorization of the Federal Surface Transportation Assistance Act to include (a) a program to address the need for equity in the apportionment of federal funds and (b) to include provisions to provide greater flexibility in the categories and uses to which a state can apply the funds."*

On the matter of equity, North Carolina has been the Number 1 donor state, as you have already heard, for the past 20 years. It is time to correct this inequity and provide North Carolina its fair share of gas

tax revenues. Our second position is:

(2) *"To oppose any program to use federal motor fuel tax revenues for deficit reduction."*

NCCBI supports the user fee concept of highway funding whereby motor fuel taxes are dedicated for highway purposes. Further, on this point, we believe that the current $11 to $12 billion in the Highway Trust Fund should be spent down over time for the purposes for which the funds were collected, i.e., highway improvements.

Also somewhat related, the NCCBI Transportation Committee adopted a position *"in support of the planning of inter-modal public transportation systems through the use of regional transportation authorities, encouraging public-private ventures and considering environmental concerns."*

Mr. Chairman, members . . . I am honored to have this chance to present these thoughts to you. We welcome further opportunities to work with you and the Subcommittee members as you prepare legislation forming the future of our highway programs.

Thank you.

38-253 O—91——103

Remarks by
The Honorable Lucy Allen, Mayor, Louisburg, North Carolina

Before the US House of Representatives
Public Works And Transportation Committee
Subcommittee on Surface Transportation Field Hearing

September 21, 1990
Research Triangle Park, North Carolina

Mr. Chairman, Congressman Valentine, Congressman Schuster, Ladies and Gentlemen, I am Lucy Allen, the mayor of Louisburg, North Carolina, a town of just under 4,000 population. But when it comes to the needs of transportation, I believe I speak for most of North Carolina. Ours is a state of small towns. We have 506 active municipalities, nearly 50% of our population is municipal, and 90% of our towns have fewer than 10,000 people.

Mr. Chairman, there are some outstanding facts about North Carolina's highways your subcommittee should know. First, North Carolina's highway network of more than 76,000 miles is the largest state-maintained system in the nation. The state is a major trucking center for the country with over 700 trucking firms providing service to virtually every community. In addition, there are more than 14,000 of miles of municipally-maintained streets. Yet North Carolina is a transportation donor state--we receive fewer dollars than we send to Washington. We get less of a return from the system than we put into the system. And our return for rural highways is undistinguished as well. The need is great, the return is small.

As a mayor, I have been active statewide and nationally in discussing the problems and opportunities of small cities and towns. From where I stand, none of these is more critical than transportation at the local level. To put things in perspective, there is no national transportation problem--what there is, is a series of individual and local transportation problems that, taken together, constitute a national need, that begins in the small towns.

Transportation is the linchpin of every community's vitality. Urban and rural areas are, for now and always, inter-dependent. Rural areas and small towns need safer and better road access to urban areas for jobs and shopping. Urban areas need access to a labor force and markets. Because we understand this locally, cities and towns in North Carolina are in the roads business as never before.

But we are not here to debate how important transportation is. We are here to point out how transportation programs and transportation funding can be improved.

In the short time I have available, I want to impress on you four things:

- The need for rural access
- The need for significant national investment to augment local funds, and
- The continued need for local involvement in transportation planning, and
- The implication of other decisions you as Members of Congress will make that control the destiny of highway funding.

Rural Access

In my view, past transportation policy has focused mighty heavily on urban and inter-urban transportation needs while failing to adequately fund transportation needs in rural areas and in small towns.

I want to emphasize in the strongest and simplest terms I know how, that adequate funding of rural access is important as a way of building up our urban areas. I encourage you to turn your attention now to better funding for problems of rural access. If you do, you will ensure the future of urban areas as the dynamos of progress we need them to be.

As you discuss and debate terms like "roads of national significance" keep in mind that in North Carolina, and much of the country, it is small cities and towns like Louisburg that will provide the growth, vitality, and economic progress for areas like Raleigh, Charlotte, Atlanta, Baltimore and the like. It is we, and hundreds and thousands of areas like us, who will fuel the engine of their prosperity. This strategic importance must be recognized and planned for in the funding of highway programs and I present that as a basic need for your Committee to address.

Local and State Investment

Local governments have been raising and investing local dollars in transportation programs while the federal government has been declining in its responsibilities. Nationally, the federal share has reached its lowest level in 27 years, while the local share has risen from 41% to 53%. Between 1984 and 1987, the federal share dropped from 31% to 23%, and all states' share from 29% to 24%.

In North Carolina, this picture is dramatically different. Ours is a true partnership in which the state understands the return on investment from highway expenditures and has put its money where its mouth is. More than $80 million is made available to municipal governments for local streets improvements and maintenance. In addition, the state raises and spends $1.1 billion for a basic state highway funding program.

In a major new initiative, the 1989 General Assembly passed legislation to finance $9.2 billion in new highway improvements over the next 13.5 years. The measure established a new Highway Trust Fund, using revenues from a gasoline tax hike and other highway use tax increases. The trust fund will finance an intrastate system of four-lane highways throughout NC putting every city and town within 10 miles of a four-lane quality road. Also funded are loop roads in some urban areas and paving of 10,000 miles of secondary roads. True, we have embarked on an ambitious plan but we need federal rural access money to accomplish this work. We could also do accomplish more with the federal money we should be receiving for a state of our size and complexity. Unless more rural access money is made available areas like mine may be penalized at the expense of other projects.

Local Involvement

Fundamental responsibility for transportation planning and decision-making should be placed at the state and local level. Local governments should have the authority and the flexibility to ensure that transportation plans support local objectives and satisfy local needs. Where there are overriding national or statewide transportation concerns, federal and state governments have a legitimate role in planning and decision-making but local governments should never be excluded from those processes.

Finally, I want to touch briefly on topics that I hope you will give more attention. The Congress's search for money to reduce the national deficit should not undermine basic principles of equity and good government.

- We **OPPOSE** eliminating the deductibility for state and local income, sales, property and real property taxes. The loss of deductibility will make it much more difficult to raise local revenues. It will put pressure on local governments to reduce spending for important projects. It will lower bond ratings, and it will increase the cost of municipal borrowing at a time when city infrastructure needs are increasing.

- We **SUPPORT** continued exemption from taxation for bond proceeds which are used to finance critical types of infrastructure facilities such as airports, roads and bridges, mass transportation facilities, and water, wastewater and solid waste facilities.

- We **SUPPORT** spending down the federal Highway Trust Fund and consider it dishonest to tax for these important highway and aviation programs and not spend the money for its intended purposes. Holding this transportation money hostage increases our tax burden and frustrates citizen's reasonable expectations of government.

I appreciate this opportunity to speak for highway needs, and I hope that you will keep these ideas in mind as you return to Washington to make important transportation decisions to benefit us all.

Thank you.

HIGHWAY SAFETY RESEARCH AND IMPLEMENTATION FUNDING NEEDS

I would like to thank you for this opportunity to appear before you and to provide testimony concerning the reauthorization of the post-Interstate surface transportation programs. I am Deputy Director of the University of North Carolina Highway Safety Research Center, a center established in 1968 to evaluate North Carolina's state-based highway safety programs, to conduct research on issues of national importance, to train practitioners in the field of highway safety, and to provide public service to local communities in their safety programs. In this 20+ years, we have conducted projects for both FHWA and NHTSA, for various private funding agencies, and, through a cooperative relationship perhaps unique in the US, for various state agencies through funding provided by the North Carolina Governor's Highway Safety Program. I will attempt to provide information about safety research funding at the federal (403) level and about local highway safety program implementation and evaluation issues (i.e., 402 issues) in the State of North Carolina.

Thank you members of this subcommittee for your past support of safety and safety research. I will share with you some success stories that show that there is a clear link between safety research and real-world implementation of successful programs that reduce motor vehicle deaths and injuries. Then, I will share some of my thoughts about the types of additional research that's needed and why. I hope that this information will encourage you to continue, and even to increase, support for highway safety research in the face of pressures to cut the budget, to increase road maintenance, to increase traffic capacity enhancements, and to do all those other things that clearly need to be done and are often more "politically acceptable" than safety programs. There is little doubt in my mind that people would rather see money spent on repairing potholes and building new roads rather than on seat belt law enforcement research. However, the payoff from these possibly "unpopular" fixes are tremendous in terms of ultimate health care cost to society and emotional costs to families and individuals. Our mileage death rate is one of the lowest among industrialized nations. Yet at the current death rate, we will be killing approximately 80,000 people each year by the year 2020.

I emphasize that highway safety is a health concern. (I am changing the focus to health since it appears to me that most people believe themselves to be experts in safety -- it being mostly "common sense" -- but not in health issues.) As a health problem, motor vehicle injuries are the seventh leading cause of death. However, because the people who die from motor vehicle injuries are so young, the societal economic loss per motor vehicle death (based to a large extent on the number of years of productive life lost) is more than three times the economic loss from each cancer death and six times the economic loss from each death resulting from cardiovascular diseases. At the same time, research funding for <u>all</u> injuries (motor vehicle and other) is only approximately 16% of that for cancer research and 36% of that for cardiovascular research. Motor vehicle injuries are the leading cause of injury deaths (32% of the total), the second leading cause of hospitalization (22% of the total), and result in the largest share of the long term economic cost (31% of the total). The 1989 report to Congress concerning <u>Cost of Injury in the United States</u> indicates that motor vehicle injuries alone are costing our society approximately $49 billion per year in long-term economic cost.

I am not an expert in the appropriation of research dollars at the federal level, nor am I an expert in the priorities for US Department of Transportation research programs. I am sure they have provided you with that information. However, I do feel strongly that motor vehicle injury research may well provide more payoff per dollar spent than many of the other types of health-related research we are currently funding with little hesitation.

Let me now move to some specific information related to research findings and needs. I first submit that the research program must be an integrated program which includes research activities related to the driver (and pedestrian, bicyclist, motorcyclist, and other road users), to the roadway, to the vehicle, and finally to local, community-oriented programs within the States (primarily the 402 funded efforts). Second, I note that while we always hope to design treatments which are successful, safety research/evaluation which shows a lack of benefit is often as important as research showing a benefit. The safety field has been characterized for decades by programs and treatments which appear logical and beneficial, but which do not reduce crash injury when carefully evaluated. Each time a poor program is either eliminated or limited due to good evaluation, dollars are freed up for the implementation of successful programs.

With respect to the driver, in my opinion we have clearly conducted research which has resulted in decreases in death and injury at both the national and state level. For example, we have identified the effects of various occupant restraint systems, have evaluated methods through which usage of these systems can be increased (both educational and legal), and have implemented these programs to the extent that we have now increased seat belt usage from a very low figure of approximately 8-12 percent before 1980 up to the current figure of somewhere between 45 and 60 percent. Unfortunately, our research also shows that the 40-50 percent who continue to not use existing occupant restraint systems are involved in more than their share of crashes. Thus, there is a clear research need to develop means for targeting the non-users, finding out why they don't use the belts and finding out what programs might work. (I have recently served on a Transportation Research Board committee in which the occupant restraint research needs have been more fully examined and defined. I refer you to TRB Special Report 224, Safety Belts, Airbags, and Child Restraints -- Research to Address Emerging Policy Questions for additional needs.)

In other driver-related areas, while we know that suspending or revoking the license of a "poor" driver will significantly reduce their subsequent crash rates, this is not a sanction that can be applied to a large number of drivers. Indeed, we have identified few educational or short term (non-sanction) programs which appear to have significant benefit. For example, there is a clear need to identify additional programs which would reduce the elevated crash risks of both the young male driver and the elderly drivers (who will become an increasing part of our driver and pedestrian populations). In terms of alcohol use and motor vehicle injury, while there has been a decrease over the past few years in the percentage of alcohol-related deaths on our highways, alcohol continues to play a very significant role in fatal and injury crashes. Our society drinks (and now to worsen the situation, some part of our society

drinks and takes drugs). We are bombarded with TV and radio advertisements which indicate that drinking is not only an acceptable part of life, but is a desirable, sexy, and almost necessary part of life. The amount of money that is spent on sending these messages to us far, far exceeds the amount of money we spend on programs to find ways to keep our society from drinking and then driving cars. Clearly, significant research is needed here to determine what can continue to reduce the incidence of drinking (and now drug-related) driving.

With respect to basic driver education programs, we have had very little success in documenting a benefit of the driver education program as it is now taught in the U.S. Perhaps this is partly because of the limited amount of hours that are spent in these programs (only six hours behind the wheel for most students) and partly because an effect for such a limited program is more difficult to quantity in our society where students have grown up with cars (and thus received some "driver training) all of their lives. However, given the high risk of teenage drivers, it may be time to look at programs which gradually introduce them into the licensed driver population by requiring that they accumulate a large amount of parentally-monitored driving experience before full licensure, or by permitting only daytime driving for first-year drivers, or, indeed, by refusing to license 16 year-olds. While these are decisions that will be made in a legislative arena, they must be based on research. These programs have not yet been tried and thus the research and evaluation has not yet been completed.

Finally, there is the issue of research that has not been done through the past 20 years in the basic areas of driver behavior -- why do drivers behave and drive as they do? My understanding is that NHTSA is beginning in a new emphasis area with respect to driver behavior including the development of a driver simulator, a move that is needed. However, I note that this possibly very expensive effort needs to be well-managed in order that it not cripple other crash-related research programs.

With respect to the roadway, FHWA's research programs related to roadside hardware, bridge rail and guardrail design, roadway geometrics, and other aspects of the roadway system have resulted in information which can be put to use daily by roadway designers and traffic engineers in their work. However, as documented in reports such as Highway Safety: At the Crossroads, we have not developed a "science-based" system for the engineer such that he or she has the safety-related knowledge to compare alternative designs in terms of potential future safety benefits and costs. Part of the problem lies in the lack of sound research information on certain roadway features or designs. Even though we have been conducting roadway research for years, there are still a number of treatments and roadway design components for which we have no defined level of safety benefit. These include such basic things as sight distance at intersections, the benefits of lower level (less expensive) guardrails or safety hardware on low volume roads, the effect of increased use of heavy and larger trucks on our highway, the effects of various types of signalization at our intersections, and others. These problems have been noted by others in their work and clearly need emphasis and increases in research funding.

But part of the problem also lies with the education engineers receive, the transfer of safety knowledge to the design manuals and warrants used by these engineers, and the priority of safety in the existing State and Federal highway bureaucracy. While I am certainly not criticizing FHWA for the work they've done from a safety research point of view, I agree with the aforementioned report that it is the case that safety has not been given a high enough priority within the engineering community. (I say this as a traffic engineer myself.) There has been little safety education provided to engineers in our roadway engineering curriculums, nor has there been the transfer of research-based knowledge to these engineers in their on-going work. Thus, there are not only research funding needs, but also needed study of how safety could receive a higher priority in the decisions made at both the federal and state level. There is also documented evidence in the same report that some states have not done an acceptable job of spending even those limited highway safety funds appropriated for spot-improvement programs, nor have they evaluated treatments implemented such that future knowledge can be developed. As I expect has been noted by previous speakers, North Carolina has a long-established program of hazard correction in our State. In addition, our DOT is moving even further forward by establishing a highway safety team within the Division of Highways whose job will be to ensure that the various safety-related programs being conducted within the DOT are coordinated and that safety does receive the needed priority in both design and rehabilitation efforts. Similar programs need to be implemented (indeed, required) in other states.

With respect to the vehicle, NHTSA and automobile manufacturers continue to carry out programs aimed at making the vehicle safer, and these efforts have significantly increased the crashworthiness of these vehicles. However, our progress to date may well be changed by continued increases in oil prices and by the demands of our environment which will require more fuel-efficient (smaller, lighter) vehicles. Such changes will result in safety tradeoffs, tradeoffs which need to be studied carefully before decisions are made.

I would also note the need for more coordinated research between those designing vehicles (or vehicle regulations) and those roadway researchers who are responsible for designing roadside hardware (e.g., guardrails, breakaway sign posts, utility pole treatments, etc.). We change vehicle designs each year, but the safety hardware beside our roadways stays in place for up to twenty or more years. Since the hardware design is based largely on the results of crash tests involving vehicles in the fleet at the time of design, subsequent (sometimes minor) changes in such parameters as the stiffness of the vehicle fronts or doors, the height of the frame, or the seating height of the driver can cause well-designed hardware to quickly lose a significant part of its effect due to changes in the vehicle fleet.

A final vehicle-related issue that I bring to your attention is the need to build safety research into the new work now being done in the Intelligent Vehicle/Highway System arena. My understanding is that this will be an emphasis area for FHWA, NHTSA and private enterprise over at least the next few years. I note that, in addition to US/foreign economic factors, the primary rationale for this work is to increase capacity, i.e., to move more vehicles on our limited roadway network. This effort clearly has immediate safety implications (such as possible driver distraction from "heads-up" displays),

but also leads to the possibility of future enhancements in overall vehicle safety. There is a safety subgroup involved with the Automated Driver Information Systems workgroup. What is needed is to keep safety as a priority issue in this work, to identify both short-term and long-term research needs, and to fund them adequately.

With respect to local programs, I submit that the majority of safety programs that are implemented in local communities in North Carolina and a significant number of safety programs implemented on a statewide basis have been a direct or indirect result of 402 funding. As described in earlier testimony by Mr. Paul Jones, Governor's Highway Safety Representative, 402 funding has allowed our state to design trial programs based on our best knowledge, to implement these programs, and then to evaluate these programs to determine if they are having the expected benefit. It has also allowed us to evaluate other programs that the state already had implemented and make recommendations concerning their future. While I cannot speak for the other states, I feel that the 402 program has been a success in North Carolina. Let me provide one example of this success.

In the early '80's, our observational and crash report data indicated that infants and young children were being protected by restraint systems only approximately 3 to 8 percent of the time. Using 402 money, we then began an effort to determined the size and nature of the problem in order to design a series of possible treatments. We tried educational programs at physicians offices alone. We tried public education programs and the establishment of community restraint-loaner programs. These were not enough, but because of health-related interest that had been generated in local communities (mainly by 402 activities), our state legislators were convinced to pass a child safety seat law. Our usage level in North Carolina is now over 85% for children less than 5 years of age. It is estimated that over 300 children have escaped serious injury as a result of this safety seat use. This would not have occurred without these 402 funds. As an offshoot of this activity, during the early years of the program, 402 dollars were used to help establish programs in which local community groups across the state were provided with training and matching safety seats which were to be loaned out to people who could not otherwise afford to buy one or who would not purchase their own restraint for other reasons. At the peak, staff at the Highway Safety Research Center were working with and monitoring the progress of 134 of these programs. However, the ultimate success of this project is that although funding for these programs was stopped in October of 1986, our latest inventory shows that almost 100 of these programs continuing to operate in the communities. This represents a tremendous number of hours of volunteer time and a large number of children that have been protected, all as a result of 402 funds.

This is only one success story. There have been others. I fully believe that 402, if properly managed and properly implemented, can be a very successful compliment to the 403 research and implementation efforts at the national level. I believe that our success has been the result of a number of factors, with two of the primary ones being an early strong link between the GHSP program and the research and evaluation expertise at HSRC, and good GHSP administrators and personnel. While my opinion may not be shared by all, I believe that to be successful, the 402 programs have to be coupled with

evaluation and research expertise which can help define possible treatments based on research knowledge and can evaluate trial programs to determine which are beneficial and which should be dropped or modified. I would urge continued funding of this effort with the guidelines that it be a program and evaluation effort rather than just a series of projects designed by well-meaning administrators or local "safety experts" who may or may not be knowledgeable concerning what works and what doesn't. We have been very fortunate in North Carolina in that the administrators have either come into the program with knowledge of the highway safety area or have been willing to gain such knowledge quickly in their tenure. I think this will continue to be the case in our state and would hope it would be the case in other states.

In summary, I have mentioned a number of areas which I feel deserve research and implementation efforts and funds. I began this talk by saying that there are also tremendous needs for roadway maintenance and construction activities. I am certainly not trying to make this a battle between construction and maintenance needs and safety needs. I hope and trust that there will be enough money for all of these needs, as all are essential to an integrated program. However, given my years of experience in safety research and in safety program implementation, I do feel that in times of short budgets, increased inflation, and increasing pressure from the public to make their "driving lives" better immediately, there is the tendency to meet immediate demands rather than the more nebulous long-term costs of future health care and emotional trauma. However, these long-term costs are the ones that will be most important to not only our current generation but also to the generation that my child and yours belongs to. I realize that I may be "preaching to the choir" in my remarks to you, but I hope that some of this information will help you carry this message to you fellow committee members and to the rest of Congress in the STAA budget deliberations.

Thank you very much for your attention.

Date: 9-18-90

On behalf of North Carolina's Piedmont Triad, eleven counties in which Greensboro, High Point, and Winston-Salem serve as its urban core, I urge The Subcommittee on Surface Transportation to give strong consideration to the following matters.

1. RETURN TO NORTH CAROLINA OUR FAIR SHARE OF FEDERAL DOLLARS FOR BOTH ROADS AND TRANSIT.

North Carolina has an outstanding road system. We have committed approximately 9.2 billion dollars to the Highway Trust Fund for use during the next thirteen years. Unfortunately, the federal government does not return enough of North Carolina's tax dollars for transit and highway use. Since 1956, for highway use, we have received eighty-five cents on the dollar. Since 1986, for transit use, we have received five cents on the dollar.

2. PROMOTE USE OF PUBLIC TRANSPORTATION BY PROVIDING INCENTIVES FOR COMMUNITIES TO DEVELOP REGIONAL PUBLIC TRANSPORTATION SYSTEMS.

Our letterhead is printed on 100% recycled paper.

The role of motorized vehicles must change. Piedmont Triad, North Carolina, the state of North Carolina, and the nation must face the facts - petroleum sources are decreasing, the availability of roadway developable land is diminishing, and air pollution levels are increasing.

In the Piedmont Triad, we have the opportunity to avoid the gridlock other regions have experienced by planning ahead. To do this successfully, we will need the help of both state and federal governments. Citizens have worked for the last two to three years pursuing the possibilites for light rail and a regional transportation system.

* In February 1988, the Forsyth County Planning Board established an Ad Hoc Light Rail Committee to explore the use of light rail.

* In May 1988, this ad hoc committee took the concept of light rail to Piedmont Triad Horizons. (Horizons is an organization which promotes cooperation and action among the eleven counties of the Piedmont Triad.)

* The two groups combined efforts so that <u>one regional committee</u> could pursue the use of light rail.

* In the spring of 1988, North Carolina's Govenor Martin appointed a task force to study rail passenger traffic in the state using the NC Railroad and the NC and Atlantic railroad tracks.

* Piedmont Triad Horizons is hosting a regional transportation alternatives conference on September 19, 1990. The purpose of the conference is to bring elected officials, transportation staffs, and concerned citizens together to hear the same information and to focus on securring an effective public transportation system for our region.

* We can see a Triad rail system tying into a state system. In the Piedmont Triad we have an abundance of existing rail routes. There are five major routes in Forsyth County and, six in Guilford.

What is needed now is a study to determine the feasibility of light rail in the Triad region. For the future, we are asking that the federal government give priority to the development of regional public transportation.

In conclusion, citizens in North Carolina's Piedmont Triad request that when recommendations are made for reauthorization of the Post-Interstate Surface Transportation Programs, two concerns receive priority: (1) Fair allocation of monies and (2) Support for the development of regional public transportation systems.

STATEMENT FOR PUBLIC HEARING
SUBCOMMITTEE ON TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

Robert J. Godding
September 21, 1990
Durham, North Carolina

Honorable Members of Congress, Distinguished State and Local Officials, and Other Interested Parties, my name is Bob Godding, and I'm the Director of Transportation for the Town of Chapel Hill, North Carolina. Currently, I am also the President of the North Carolina Public Transportation Association. Our membership includes 41 transportation operators, mostly public but a few private providers in both rural and urban communities across the State of North Carolina. I thank you for the opportunity to present comments as you undertake the most serious task of considering the Reauthorization of the Surface Transportation Act.

Public Transportation Systems in North Carolina have been asked to play an expanded role in helping to solve some our state's serious transportation problems. In many of our rural and urban areas, we are unfortunately strangling on our own success. Increased demand and utilization of our services has exceeded our operating capacity. Much of this growth has occurred in our rural areas. However, recent environmental reports show that several of our urban areas are not meeting minimum air quality standards. This of course, has resulted from traffic congestion and our overwhelming reliance on the private auto. The urban public transportation operators will be pressured to help solve this problem.

This increase in demand has reduced the ability of available financial resources to deliver needed services. We are seeing dramatic reductions in the availability of federal capital and operating dollars to finance transportation programs. For capital programs in Chapel Hill for example, our share of the local match has increased 100% over the last year.

As we make a request for additional federal financial assistance, we are quite sensitive to the fact that we must continue to also fight for a stronger involvement at the local level. We also realize that our State efforts to solve these problems are not what should be expected from a State of our size and stature as North Carolina. As a Statewide association, we promise to work on all possible fronts to insure that each responsible jurisdiction shares in obtaining

the resources that are needed to get this job done.

We hope that as we proceed into the future, a reauthorized Surface Transportation Act will provide a reliable and predictable level of funding, one that represents a fair federal share of meeting our citizen's public transportation needs.

Specifically, I ask that you consider the following:

- The adoption of an increase in the federal gasoline tax to provide additional public transportation funding. This would result not only in a reliable funding source but it would also stimulate the driving public to reconsider how efficiently they are using their cars. It could also relieve the current burden of general fund financing of public transportation programs.

- Eliminate federal tax policies that subsidize auto use and discourage transit use and private investment in transit capital.

- Provide adequate funding to cover the cost of those federally mandated activities contained in the Americans with Disabilities Act and the Clean Air Act.

- Continue an adequate program of operating assistance for all types of transit systems, but insure that the program encourages the productive use of public resources, and reliable levels of service to the public.

The current situation in the Middle East, dramatizes quite clearly the importance and magnitude of our domestic transportation problem. We have squandered an opportunity over the last 16 years since the first "oil crisis" to take the steps to eliminate our dependance on imported oil. As a nation we are addicted to oil. We are responsible for 20% of the annual global consumption. Although many steps must be taken to reduce this addiction, improving our public transportation systems is certainly one of them. We look forward to working with you to make that a reality.

Thank you again for the opportunity to speak. I hope that you enjoy your visit to North Carolina

Testimony of Senator William Goldston
Congressional Field Hearing
On the Federal Surface Transportation Act
Friday, September 21, 1990

I am William Goldston, Chairman of the North Carolina Senate's Transportation Committee. Recently I served as a co-chairman of a bipartisan Highway Study Commission consisting of Legislators, Mayors, business leaders, and county officials. The purpose of the study commission was to closely examine the increasing transportation needs facing our growing state and make recommendations to the General Assembly.

The study commission found that North Carolina was in fact growing. Our state demographer estimated at that time that our 1990 population would exceed 6.6 million people, a 12 percent increase from the 1980 total. He went on to project that the population would increase another 10 percent between 1990 and the year 2000 to exceed 7.2 million in that year. The growing population was also a changing population with increased automobile usage and greater transportation needs.

Unfortunately, our investment in transportation had not been keeping pace with our needs. In 1988, our Department of Transportation estimated that we had a backlog of highway construction needs exceeding $10 billion. This did not include the future needs that were accumulating at a rate of approximately $550 million per year, but included only those projects that were needed immediately at that time to relieve urban congestion and provide additional capacity for over burdened rural roads. When combined, the existing and future highway needs for the state were estimated to total more than $16 billion by the year 2000.

Our highway construction program, on the other hand, which consisted of the federal aid programs and a small $60 million per year state appropriation, was estimated to generate only slightly over $5 billion for that same time period, leaving a backlog of needs in the year 2000 of more than $11 billion not accounting for inflation. This meant we were not keeping up with our annual needs, and doing very little to chip away at the existing backlog.

As a result, the Highway Study Commission recommended an $8.6 billion state funded highway construction program over a period of twelve years. The General Assembly modified that to $9.2 billion over 13.5 years, but kept intact the four basic goals the study commission had established for the new money.

Those goals are: 1) To construct 1700 miles of new four-lane highway and widen and improve 113 miles of existing Interstate highways on the 3600 mile Intrastate System. This is a specially designated system of roads consisting of all of the Interstate routes, most of the primary routes, and some of the strategically

significant secondary routes that when completed will result in a four-lane network of highways interlacing the state;
2) To complete portions of urban loops around seven of our major cities, to help relieve urban congestion;
3) To pave 10,000 miles of our unpaved secondary roads in order to get our rural residents out of the dust and mud; and
4) To increase the level of funding provided to the municipalities for the maintenance of their roads.

When passed by the legislature in July, 1989, the Highway Trust Fund program, as we called it, represented a major initiative on the part of North Carolina to address its own transportation problems.

Now that I have spent the last couple of minutes bragging on the North Carolina Program, I want to make a couple of points pertinent to the future Federal program.

First, although we in North Carolina have faced our transportation problems head-on and have now committed a significant amount of state funds to address them, it does not lessen the need for a federal program. We see our efforts as complimentary to the very much needed federal effort. Together, the two programs still do not completely erase the combined total of existing and expected needs anticipated for the year 2000, but they do a much better job of addressing those needs than either program can do alone.

In addition, a new federal program should not penalize a state such as North Carolina that has taken the initiative to address its own needs. North Carolina has been at the bottom of the bucket long enough. Since 1956, we have sent nearly two billion dollars more to Washington than we have received in transportation programs. We want to make sure that the funding levels, categorical formula criteria, and matching ratios for any future federal program are developed independently of individual state initiatives. No state should be directly or indirectly penalized in the distribution of federal funds for taking steps to address its own needs.

Finally, we believe that the federal motor fuels taxes should not be raised unless they are going to be used for transportation purposes. As a result of our Highway Trust Fund program, North Carolina raised its motor fuels tax by what amounted to about a nickel per gallon. Our new total of 21.75 cents per gallon is among the highest in the country. We are strong supporters of the "user pays" concept. Our legislature and citizens supported the tax increases because the taxes were going towards much needed transportation improvements. I don't believe the people of this state will support a gas tax increase that isn't directly linked to transportation improvements.

Again, thank you for giving me the opportunity to speak to you today.

TESTIMONY

before
the
SURFACE TRANSPORTATION SUBCOMMITTEE
of the
HOUSE PUBLIC WORKS COMMITTEE

on
REAUTHORIZATION
of the
SURFACE TRANSPORTATION ACT

September 21, 1990
Field Hearing

presented by

Wilber P. Gulley, Chairman

Research Triangle Regional Transportation Authority

Mr. Chairman and honorable members of the Subcommittee, thank you for the opportunity to testify before you today on the subject of reauthorization of the Surface Transportation Act.

My name is Wib Gulley. I am Chairman of the governing board of a newly created unit of government - the Research Triangle Regional Public Transportation Authority. We have mercifully adopted the DBA of the Triangle Transit Authority or TTA.

The TTA was created to plan, finance, organize and operate a public transportation system for the Research Triangle area. The service area includes Durham, Orange and Wake Counties and the Cities of Durham and Raleigh, the Towns of Cary and Chapel Hill, the Research Triangle Park and the Raleigh-Durham International Airport, an area with a population of nearly 700,000.

This public transportation system will include operation of ridesharing services, and may also include operation of a system of vans and buses. The TTA is also the organization with the responsibility to determine whether or not the long term transportation needs of the Research Triangle can be best served by fixed-guideway transit.

The TTA was created amidst great hope and with great promise. It is a special purpose unit of government that is sized to fit the problem. Support for its creation was widespread. I attribute this to recognition that our major population areas are growing toward each other and that there are negative impacts of theis growth.

The points of the Research Triangle, the Town of Chapel Hill, and the Cities Durham and Raleigh, are all growing toward the center of the triangle. That new downtown center is focused on the Research Triangle Park and the Raleigh Durham International Airport.

While the regional growth we have experienced over the past twenty years is extraordinary, it is a characteristic that is shared by other urbanized areas in North Carolina. It is also shared by many other areas across the nation.

This rapid growth has led to the increasing suburbanization of our region. For the first time we must now cope with serious congestion. We are also concerned with the many impacts on our environment - the quality of the water we drink and the air we breath. We are keenly aware of the relationship of our transportation system with our land use. Because regional public transportation authorities serve multiple jurisdictions they are best equipped to coordinate and resolve land use issues.

These trends are not unique to the Research Triangle. Their importance is beginning to be more widely recognized, but our national transportation policy and programs are not well suited to respond to these emerging trends.

For example, the boundaries that delienate our urban areas are artificial when viewed from the regional perspective. They do not recognize our changing growth and commuting patterns.

While the Urban Mass Transportation Administration (UMTA) has a Suburban Mobility Initiatives program, it is, in fact, a very minor program which must compete with other discretionary funding programs. There is no section in the Urban Mass Transportation Act to address the funding needs of regional transportation programs.

I recommend that the Subcommittee consider the following issues in the reauthorization process.

- Regional, low density urban forms are emerging across the sunbelt. New federal programs should anticipate and respond to this trend.

- Both the needs and the solutions will vary. Therefore broad flexibility and descretion is necessary. The block grant approach with either no or few categories is appropriate.

- Creative alternatives to reduce dependancy on the single occpant automobile must be encouraged. Transportation block grants should both permit and encourage tradeoffs between transit and traditional road-building soultions.

- End tax-based parking subsidies which are contained in the Internal Revenue Code. Employer provided parking is not taxed as a benefit. Encourage employer-based transit subsidies. Current federal law taxes employer-provided transit subsidies over $15.00 per employee per month, with no limit on tax free parking

subsidies!!

- Provide incentives for joint public-private ventures. Transit works best when it serves dense, multiple use environments. Encourage efficient land use.

- Review federal policy "strings" for relevance. For example, the employee protection provisions of Section 13(c) of the UMT Act go well beyond their original intent. They can be intrusive and restrict innovation.

On behalf of the Triangle Transit Authority and myself, thank you for the opportunity to express our views. I will be glad to respond to any questions that you may have.

TESTIMONY FOR SECRETARY THOMAS J. HARRELSON
FOR THE CONGRESSIONAL FIELD HEARING
ON THE FEDERAL SURFACE TRANSPORTATION ACT
FRIDAY, SEPTEMBER 21, 1990

Thank you for the opportunity to speak with you this morning. I want to thank the House Public Works Subcommittee on Surface Transportation for coming to this region of the United States. I'm particularly pleased that you came to North Carolina. I want to thank Congressman Valentine for his diligent work -- and for seeing to it that highways, bridges and public transportation are put in the forefront. They certainly are issues we need desperately to deal with.

Today is one way to start that process. Tackling the job of a new reauthorization bill will be no easy task. The budget deficit and the current Middle East crises will no doubt make your job more difficult. You will have to deal with individual groups, organizations and states coming to you seeking your help in making this new bill a fair one.

And we realize how important your role is -- because this transportation bill will lead not only us, but our children and their children, into the 21st century.

What I want to do this morning is give you a North Carolina Department of Transportation perspective. We've been dealing with a situation I want you to know about.

For 34 years, North Carolina has paid in more and received less from the Highway Trust Fund than any state in the nation.

For every dollar we have contributed to the federal highway trust fund since 1956 -- and including the year we are in right now -- North Carolina has received 83 cents in return. That really represents only part of the picture. When we include the interest that has accrued to the trust fund -- which also is part of the apportionment process -- our net return is a mere 73 cents on the dollar.

During the life of the trust fund program, our state has suffered an estimated 1 billion, 910 million dollars in "lost" revenue. That's almost 2 billion dollars North Carolina has badly needed to meet the demands of a rapidly growing state -- $2 billion that has been spread across the nation through formulas that became outdated decades ago.

These facts become even more significant when you realize that North Carolina historically has had one of the lowest per capita incomes in the nation.

Out of necessity North Carolina has responded by initiating innovative state and local funding programs to make up this federal funding void. Our state gasoline tax is 21.75 cents per gallon -- the fifth highest of all states. The tax supports virtually all highways in North Carolina -- the largest state-supported system at 76,000 miles.

We have a long-standing financial relationship with our communities that dates to 1951 when we began sharing state motor fuel tax revenues directly with our cities and towns. I trust you will hear from some of our mayors today on the success of these relationships as well as the initiatives within our own municipalities to develop local funding packages necessary to get the transportation job done.

Last year, North Carolina committed an additional $9.2 billion during the next 13 years to highway improvements and expansions. In large measure, our Highway Trust Fund Law was passed because of the inability of the current federal programs to address our growth demands. We felt it necessary to "pick up the ball" so to speak. Local governments have also done the same and several North Carolina cities and counties have passed major highway and transportation bond issues.

Even so, an appropriate federal program remains critical to this partnership. The establishment of funding levels, categorical formula criteria, and matching ratios must be developed independently of these individual state initiatives. No state that has initiated major funding packages to address its own needs should be directly or indirectly penalized under a new program.

On a broader level, we support the concept of a Highway System of National Significance. However, we do not think it should be loaded up with smaller highways simply to improve a state's position in return of federal dollars. The system should be defined to include only those highways truly of national significance -- those on the Interstate system, most principal arterials, and limited others.

Also, we support the concept of two major funding programs: a Categorical Program for Highways of National Significance and a Flexible Program for all other highways. North Carolina seeks the most flexibility possible -- within these programs, and between them. We have numerous examples where categorical programs and the lack of flexibility have cost us money, delayed projects, and worked against the needs of North Carolina. A good example is our bridge program.

We recognize the fact that the Categorical Program should be driven by formulas. At the same time, it is

universally accepted that many of the existing factors driving today's formulas are out-dated and no longer reflect the needs of a national transportation system. They do not reflect the use of the system, and they certainly do not reflect the high growth that many states have experienced in the last few decades.

We know the redefinition of these factors will be difficult, but it is necessary. North Carolina largely supports formula factors based on the use of the highway system rather than its size. We think use characteristics more accurately describe the wear and tear on the system and the need for capacity expansion. Factors such as Vehicle Miles Traveled and motor fuel consumption more accurately measure the demand on the highway system than do land area, density, population, and the like. Size factors such as lane-miles do reflect the amount of pavement existing in a state, and therefore should be considered in the deterioration of the system.

USDOT's cost allocation studies in 1982 found that about 70 percent of the wear and tear on the nation's highway system was due to use. About 30 percent was a result of such factors as weather, exposure, and old age -- best measured by size characteristics. Consistent with these findings, we think use factors should be weighted more heavily than size factors in any new formula. This is consistent with recommendations of the United States General Accounting Office.

We recognize the unique difficulties in many states -- particularly the extremely rural states -- that cannot generate the tax base necessary to construct and maintain their portion of nationally significant highways. Allowances for such situations must be made. We stand ready -- as we have through AASHTO -- to continue working toward ways to accommodate a system that is fair to all states coast to coast.

While we do that, however, we should not lose sight of the basic premise that highway use causes the damage that requires repair, causes the congestions that must be addressed, and reflects the growth and access requirements that must be served.

Above all we must work toward a new or modified national program that provides funding equity to the states. We realize that any taxing system creates "haves" and "have nots," and that a redistribution of some resources must occur. At the same time, fairness must be paramount, and I will tell you today that North Carolina -- a low income state -- along with a few other states, has carried the brunt of the funding for the national program since its inception in 1956.

While we are on the subject of fairness, let's talk a bit about public transportation funding. North Carolina sends $40 million per year to Washington, and receives $2 million in return from the Public Transportation Account. This is a five percent return on investment -- the worst of any state in the nation. This, as I'm certain you will agree, is an erosion of our transportation funding base and an inequity for which correction is long overdue.

What we want and need in North Carolina from this new legislation is equity and flexibility. Equity means a fair return from the federal program. Flexibility means the ability to put the funds to work where the needs are in North Carolina. We will do that in a responsible, environmentally conscious and timely manner. We have a proven track record of responsibility and fairness that is evidenced by the relationships we have with our General Assembly, our cities and towns, and our rural areas.

The future can be exciting for us, but there is much work left to do. You will have many issues and perspectives before you. We look forward to working with you as together we face the transportation challenges ahead.

Let me say again how delighted we are that you could take the time to visit with us in North Carolina. We hope you have time to stay and enjoy the beauties of our state. We appreciate your holding this hearing in the Southeast so we can share with you some perspectives that might be a bit different from some other part of the nation.

Thank you.

New Directions in Transportation - For The Earth's Sake

Statement to the House Subcommittee on Surface Transportation
21 September 1990

Ed Harrison
Transportation Chairman, North Carolina Chapter of the Sierra Club

I want to thank the Subcommittee for giving citizens in this part of America the opportunity to express our opinion on the future directions of surface transportation in our country and in our region.

This statement is on behalf of some 12,000 Sierra Club members in this state, and for other allied organizations. The Sierra Club is gaining recognition as the environmental group most active at the grassroots level of society. As the saying goes, we think globally and act locally, down to the level of cities, towns and subdivisions. A hearing like this allows us to bring our concerns about transportation, which we have locally, regionally, and statewide, to the attention of our nation's decisionmakers.

The Sierra Club has recognized the major role of transportation in determining environmental quality since the National Board of Directors adopted a transportation policy in 1977. Because the facts haven't much changed since then, our policy stands, and all that's changed on our end is that an ever-larger number of Sierra Club members express concerns about our nation's directions daily, in a ever-widening range of places.

The facts then and now are that: Transportation is the main consumer of our energy resources, especially petroleum. Transportation facilities dominate our patterns of land use. Motor vehicles are a major source of air pollution in urban and other areas - in North Carolina *the* major source. And these vehicles are responsible for a significant amount of the runoff of oil and other toxic substances in the waters of the United States.

Now, as in 1977, we see that our national transportation policies have had major impacts on our *social* environment - an arena of much concern to the environmental community. Past policies have been a central factor in the decline of American cities. Inappropriate transportation technologies - the emphasis on cars above all - and discriminatory funding formulas have combined to create levels of pollution and congestion which cause flight from our central cities. The resulting urban sprawl costs America heavily in the consumption of energy and, above all, *land*. As you know, they're not making any more land, and oil's getting hard to come by.

Now, as then, we contend that governmental policies haven't yet paid sufficient attention to the need for energy conservation, or to the need to encourage transportation modes which pollute less and take less land. National policies continue to subsidize most the least efficient mode, highways for motor vehicles. According to the U.S. Conference of Mayors, federal transportation funds have favored highways over transit by more than 8 to 1.

Unfortunately, this economic advantage for asphalt and automobile is augmented at the state and local level. When local governments and taxpayers provide free or abundant parking in business centers, the public loses the incentive to use transit instead of the single-occupant vehicle so common on our congested highways. At the same time, over-abundant cars mean that businesses and individuals pay the costs for health damage and

lost work due to smog, for damage to crops and buildings from smog, and for the time lost in our lives to traffic jams.

We believe that our North Carolina state government has chosen the incorrect, short-sighted solution to congestion by foisting a $ 9 billion roadbuilding program on us without allowing a bond referendum vote. We see something on the order of a 13 to 1 ratio of highway funding to that for transit, and we see transit taking it on the chin. At the same time, this region's Triangle Transit Authority, discussed earlier by Mr. Wib Gulley, has not been deemed worthy of state funding by our Legislature.

Here in the rapidly-growing Piedmont Crescent of North Carolina, the environmental community sees transportation priorities as a front-burner issue of public policy. We arrived at this point because of grappling with issues of urban growth, land use and natural resource protection. Throughout the 1980s, the cities of the Piedmont put great effort into protecting surface drinking water supplies against damage from urbanization. Many of us came to realize that all our efforts in this regard were useless as long as our dominant patterns of surface transportation were unchanged. My examination of highway plans and programs shows that the five largest cities of central North Carolina each have interstate-level highways crossing, planned to cross, or proposed to cross the areas closest to their water supply lakes. Most of these highways will be funded by the state's trust fund, but some will have Federal funding as well. As we said earlier, motor vehicles put much toxic runoff into our waters. So we can't help but see transportation policies which subsidize highways over transit as a threat to the public health. As well, the loss of our green "breathing" spaces around lakes and streams to road pavement threatens our public health.

From a local and regional concern with protecting drinking water and other natural resources, to a statewide concern with disproportionate funding, citizen transportation activists like myself turn to you, our decisionmakers at the Federal level, for help in changing America's priorities. As Congressman Valentine told us in his District newsletter this summer, the taxpayers of North Carolina receive a nickel in transit funding for every transportation dollar they put in. Every day, more of us see the need for a change in our situation.

And every day, more North Carolinians - and Americans generally - are speaking out about the connection that they see between the crisis in the Middle East and the way we transport ourselves at home. Our nation's past transportation policies have resulted in patterns of vehicle and land use that consume 2/3 of our oil. Many of us hope that this is the last time that America needs to put lives on the line to protect oil supplies, to preserve an increasingly outmoded way of moving ourselves, the single-passenger automobile.

If the use of alternatives to the single-occupant vehicle is made easier and cheaper, then Americans will go with transit over cars. As long as it's easier for governments to fund more and wider roads instead of the transit alternative, Americans won't have the second option. As long as highways come first, America will continue to generate the vicious cycle of sprawl, congestion, more roads, more cars, and more sprawl, costing us energy, land, and environmental quality.

Our Sierra Club position, here and nationwide, is that **the major goal of transportation is to move people and goods, not cars and trucks**. America's surface transportation program should focus on transit and other alternatives to the single-occupant vehicle, such as incentives to carpooling (High Occupancy Vehicle lanes). This transit focus should be combined with incentives for mixed-use, infill land uses as a counter to urban sprawl. **Our national goal should be to reduce the need for new roads and the need for further petroleum consumption.**

To reform our transportation priorities, both decisionmakers and the public need a deeper understanding of the issues. The Sierra Club urges you to:

1. **Sponsor research to:**

   - **compare the relative impacts of highway to transit expansion (with infill development) on:**

     - sprawl and traffic congestion,
     - loss of forests, farms, etc.,
     - consumption of energy and materials in construction,
     - consumption of energy and water in the new developments,
     - production of air and water pollution,
     - the condition of inner cities and their residents.

   - **evaluate all present subsidies to motor vehicles**

2. **Adopt a surface transportation program that includes:**

   - **full cost pricing of auto use** - gas taxes, auto sales taxes, licensing and registration fees, smog fees, toll roads, and elimination of subsidized parking - to recoup the full cost to American society of roads, cars and trucks.

   - **use of these taxes and fees to build and operate adequate transit systems**, with the remainder used to compensate state and local governments for their auto-related costs and reduce sales and property taxes. Assure that transit funds are wisely used by requiring recipients to zone for compact, energy-efficient urban development.

As a spokesman for the environmental community on this state's massive Highway Trust Fund, I made some of these same requests last year to the North Carolina General Assembly. We are hoping for better from the United States Congress than another highway fund, another status quo. It's my hope that Congress, which succeeded in an excellent re-authorization of the Clean Water Act, and which is approaching similar success on the Clean Air Act, will see that a re-authorized Surface Transportation Act can also have crucial environmental benefits for this nation. To benefit us all, you will have to move transportation in a new direction. The Sierra Club hopes that this statement, and others you may hear in other places, has told you how vitally important it is to change the way we move ourselves, and the way we use energy and land

Testimony of Representative Sam Hunt
Congressional Field Hearing
On the Federal Surface Transportation Act
Friday, September 21, 1990

I am Representative Sam Hunt, chairman of the North Carolina House of Representative's Infrastructure Committee and co-chairman of the Joint Legislative Highway Oversight Committee. Representing the other chamber of our General Assembly, you know that I have to do a little bragging of my own about our new Highway Trust Fund legislation here in North Carolina. While doing that, however, I hope to make a few points about the direction I think the future federal program should take.

The North Carolina Highway Trust Fund Program received strong support from both houses of the General Assembly and from the public as well. In the House, under the leadership of Speaker Mavretic, there was near unanimous support. I believe the strong support for this program results from the fact that it is inherently fair and flexible.

The Trust Fund law is a carefully crafted piece of legislation that provides a little bit of something for everyone. It addresses the problems of urban congestion while also providing for much needed rural access. It commits the state to paving 10,000 miles of dirt roads in 10 years while also making a commitment to 481 cities to increase the amount of state funds they can use to maintain their local streets.

The Trust Fund program specifies a 3600 mile system of highways that we call the Intrastate System. However, this system could just as easily have been called the Highway System of State Significance. Once completed, this system will provide a modern four-lane highway within 10 miles of 96 percent of the state's population. When combined with the Urban Loops Program, it will provide opportunities for economic development in rural areas all across the state, while reducing the drag on economic progress caused by congestion in our urban areas.

To assure an equitable distribution of funds in a timely fashion, we included a funding distribution formula that is based on fair and appropriate criteria. This formula requires that the funds for all highway improvements, except the urban loops, be distributed to seven large geographic areas in the state over the seven year period of our Transportation Improvement Program. The General Assembly created this formula to assure the fair disbursement of funds to all areas of the state, but left it flexible enough so as not to overly restrict the DOT in the setting of priorities or the programming of projects.

That kind of flexibility is perhaps the greatest strength of our new Highway Trust Fund program. In response to the rigidness of the existing federal categorical programs, we deliberately provided an option to the DOT that allows them to

exchange--dollar for dollar--funds from the North Carolina Trust Fund for funds in the federal programs. In essence, we have built some flexibility into the federal program here in North Carolina. By providing an adequate funding level, and allowing the professionals to choose the most appropriate funding for a particular project, we have freed them of some of the unintentional restraints associated with the federal programs. In the process, we have freed up additional state funds that can be used without restriction for projects not included in either the Intrastate or Urban Loop systems. This provides additional flexibility in addressing the many and varied transportation needs facing our state.

We have afforded ourselves this flexibility by committing a considerable amount of state funds to our transportation problems. However, not all states are willing or able to make this kind of commitment. This is where my bragging ends and my thoughts for a future federal program begin.

Like our Highway Trust Fund program, I hope the new Federal Aid Program will provide a little bit of something for everyone. I believe the best way to accomplish that is to make the new program as fair and as flexible as possible.

Fairness can be addressed in the distribution of funds and the selection of formula criteria. North Carolina is tired of being last in terms of program funds received for the amount of revenues collected. We want a better return on our investment. We want funds to be distributed fairly based on criteria, such as fuel consumption and vehicle miles traveled, that are closely related to the use of the highway system. If this can't be achieved, we want the minimum allocation percentage raised to at least 90 percent.

Flexibility can be achieved through the two major programs now under consideration: A program for Highways of National Significance and a Flexible Program for other national issues. We would like to see the greatest amount of flexibility possible built into and between these two programs to allow the states and local governments to address their transportation problems in the most effective and efficient manner.

I believe North Carolinians have shown that we are willing and quite capable of taking care of our transportation problems with the assistance of a fair and flexible federal program. We should be given that freedom in any new federal program to do just that. Thank you.

38-252 O—91——104

State of North Carolina

Governor's Highway Safety Program

JAMES G. MARTIN
GOVERNOR

THOMAS J. HARRELSON
SECRETARY OF TRANSPORTATION

PAUL B. JONES
DIRECTOR, GR

Statement of the
Governor's Highway Safety Representative for North Carolina
before the
Surface Transportation subcommittee
Public Works and Transportation Committee
A. S. House of Representatives
September 21, 1990

My name is Paul Jones, Governor's Highway Safety Representative from North Carolina. My office is responsible for coordinating and managing the state highway safety program. Our mission, working with a variety of state agencies, is to improve the safety of our state's highways through increased safety belt and child restraint use; reduced incidence of impaired driving; stricter enforcement of speed limits; improved truck, school bus, motorcycle, bicycle, along with pedestrian safety, and enhanced roadway safety.

It is my pleasure to appear before you today on behalf of thousands of highway and traffic safety professionals in North Carolina to discuss the reauthorization of federal highway safety programs and other matters of concern to our office and that of other state and territorial highway safety offices.

Highway Safety: A Persistent Problem

Currently, the United States enjoys the best highway safety record of any country in the world. Over a twenty-year period from 1967-1987, the mileage death rate in this country dropped from 5.2 deaths to 2.4 deaths per 100 million miles of travel. (The 1989 mileage death has dropped to 2.2 which is the lowest mileage death rate to date.) In the last eight years alone, the death rate from motor vehicle crashes has been cut by more than 25%. The National Highway Traffic Safety Administration (NHTSA) estimates that, in 1988 alone, 6,506 lives were saved by highway safety laws and programs: 4,500 saved by safety belts; 1,148 saved by minimum drinking age laws; 608 saved by motorcycle helmets; and 250 saved by child restraints.

215 East Lane Street, Raleigh, North Carolina 27601, 919/733-3083

Despite the positive impact federal assistance and state and local highway safety programs have had on highway safety, motor vehicle deaths and injuries continue to be a major problem in this country. 47,093 people were killed in motor vehicle crashes in 1988 - the last year for which complete statistics were available - and an estimated 3.4 million people were injured. Every 10 minutes, there is a traffic fatality, and every 10 seconds, a traffic-related injury. The annual death rate from motor vehicle crashes is the equivalent of crashing an airliner with 129 persons on board every single day. In North Carolina, we record one traffic mishap or crash every 3 minutes. We injure one person every 4 minutes. From the time most of you arrived last evening until you depart this afternoon, 3 people will have died on our state's roadways - one every 6 hours.

In 1988, our most recent year for an accurate breakdown on the national data, half of the fatalities were alcohol-related (including pedestrians, non-drivers, and drivers whose blood alcohol level did not exceed the legal limit), 17,500 were unrestrained occupants, 6,900 were pedestrian fatalities, 13,585 involved light trucks, and 3,661 were motorcyclist (and other motorized cycles) fatalities.

The magnitude of motor vehicle injuries represents a major public health and catastrophic medical payment problem for the country. About one-third of all the unintentional injury deaths are caused by motor vehicle crashes or other roadway mishaps. The leading cause of death for children and young persons aged 1-34 is motor vehicle crashes. For all ages, the motor vehicle injury death rate is surpassed only by the rates for heart disease, cancer and stroke. Traffic injuries are the leading cause of paraplegia and quadriplegia, and are the leading cause of new cases of epilepsy. For business and industry, traffic related injuries represent the leading cause of lost productivity in the work place, and are a major contributor to industry's rising health and Workman's Compensation costs.

The estimated economic cost of motor vehicle-related fatalities and injuries to society is staggering. According to the Cost of Injury in the United States (1989), the cost of motor vehicle crashes to society is $48.7 billion a year. This estimate, which many in the highway safety community believe is very conservative, does not include the non-quantifiable costs associated with human suffering and trauma, or societal costs associated with the long-term loss of productivity. Traffic injury costs, according to Injury Prevention: Meeting the Challenge (1989), are second only to cancer in their economic cost. Unlike cancer and other disabling diseases, however, most of the economic costs associated with motor vehicle deaths and injuries can be avoided through prudent investment of governmental and private sector resources in proven highway safety countermeasures.

If traffic continues to grow at about 4% per year in the future, as the Highway Users Federation projects, and if the 1987 mileage death rate of 2.4 deaths per 100 million miles of travel is maintained, then annual fatalities may exceed 60,000 by the year 2000 and may be as high as 80,000 by the year 2020. The rate would have to be dropped to 1.4 deaths per 100 million miles of travel just to maintain a fatality frequency of 46,000 fatalities a year - a level which, in itself, represents a totally unacceptable loss of human life.

Increased truck travel, greater reliance on the automobile for commute trips, increased suburbanization and a deteriorating highway system will adversely impact the safety of the nation's highways over the next decade. More federal, state, and local and private sector resources will have to be devoted to highway safety to reduce the fatality rate and to offset some of the demographic, social and economic trends of the future.

Current Federal Assistance Programs for Highway Safety

Much of the progress made in highway safety can be attributed to federal highway safety legislation of the past twenty years (such as the Highway Safety Act of 1966) and the federal grant funds authorized by that legislation. The federal State and Community Highway Safety grant program (23 U.S.C. 402, commonly known as the 402 program) is the major source of funding for state highway safety programs.

Two major features make this federal grant program unique and contribute to its effectiveness. First, unlike other federal grant programs, the 402 program operates as federal "seed money" for state and local highway safety programs. 402 grants are available over a three-year period, requiring grantees to assume a greater portion of the cost assumption each year. Highway safety programs funded with 402 funds are expected to be self-sufficient by the end of the third year; therefore, the 402 program does not encourage state or local dependence on federal grant assistance:

- In North Carolina, 402 funds were used from 1983-1986 to create a D&E Enforcement Team. The program in Mecklenburg County resulted in a significant increase in DWI arrests, fewer DWI related crashes and injuries. The police department learned new manpower allocation and enforcement techniques, which were applied department-wide. In addition to maintaining the team commitment to DWI enforcement and education, the department learned to work smarter with expanded resources to combat the impaired driver problem.

- The Mecklenburg County Police Department, with approval of the Governor's Highway Safety Program, used a small portion of its 402 contract money in 1986 to help underwrite the startup of a local alcohol and drug-free Project Graduation. Since the first grant, the Police Department has continued

to use its own money in the same $5,000 amount each year to support Project Graduation. In June, what was once a local county project at a theme park (Carowinds), grew into the largest Project Graduation one-night program for graduating seniors in the country. Over 12,500 seniors and their guests from 44 high schools in seven counties from North and South Carolina celebrated all night, free from alcohol and other drugs. The initial $5,000, initially provided through 402 funds through a local police department, has been a catalyst for nearly $500,000 in direct and indirect contributions for Project Graduation

- In North Carolina, 402 funds in the Governor's Highway Safety Program alcohol, education, and information budget was used to leverage over $1.2 million in private sector support for a concentrated advertising and public information campaign.

- 402 funds have been used in North Carolina to expand the capabilities of the Highway Patrol and local police agencies to apprehend speeding motorists and impaired drivers. The expanded capabilities, through the purchase of additional speed timing devices and preliminary breath screening devices, has renewed enforcement's interest in traffic safety.

- A small grant to East Carolina University supported the development of a motorcycle safety course. Sanctioned by the Legislature, the course will be taught through the community college system.

Second, states use 402 funds to leverage other state and local funds, private sector contributions, or voluntary assistance. In some cases, the leveraged funds (or in-kind assistance) equal to or exceed the federal grant. As a result, the 402 program is probably one of the most cost-effective grant programs provided by the federal government:

- Under Pennsylvania's Corridor Safety Initiative Program, the state has targeted a 17-mile stretch of Route 65 for an intensive combination of safety programs, including highway improvements projects, coordinated enforcement efforts, increased public information and education programs, and advanced emergency medical services. 56% of the funding from this project comes from 402 funds and 44% is funded by the state.

- During FY 89, Virginia began a program to train police officers in selected jurisdictions to recognize drugged driving behavior. By the end of the fiscal year, there were 23 trained instructors, 47 trained enforcement officials, and 100% increase in drugged driving arrests. $71,000 in 402 funds were expended for the project, while the states

and localities contributed approximately $500,000 in police time and laboratory analysis costs.

- In California, the state developed the "I'd Rather Drive" public information campaign with $150,000 in FY 89 402 funds and $125,000 in state funds. The campaign was designed to make young people aware of a new driver's license suspension law which affects those between the ages of 13 and 21 who have committed any drug and/or alcohol offense. The campaign has been so well received by the schools that the state plans to broaden distribution to theaters and private schools.

Federal 402 funds may be used to fund a wide range of projects including: occupant protection, impaired driving, police traffic services, motorcycle safety, roadway safety, traffic records, and emergency medical services. States may fund other types of highway safety projects, such as pedestrian and bicycle safety, if they submit additional justification and explanation to NHTSA.

Additional federal assistance is provided to states under the Federal Highway Administration (FHWA) 402 program which provides funds for traffic control device inventories, improved safety data collection and analysis systems, training and technical assistance and other activities.

Funds are also provided under the 403 program (23 U.S.C. 403) for highway safety-related research and demonstration programs (which is a discretionary assistance program available to states, localities, universities, non-profit associations, etc.), and under the 408 and 410 incentive grant programs (23 U.S.C. 408, 410) for state drunk driving prevention programs. A small number of state highway safety offices receive truck safety assistance through the Motor Carrier Safety Assistance Program (MCSAP) and the Commercial Driver License (CDL) implementation grant program which are administered by FHWA. A few state highway safety offices receive funds for drugged and drunk driving prevention programs under federal drug legislation.

Federal Highway Safety Program Impact

Over its twenty-year life, the 402 program (and other related programs) has had an extremely positive impact on highway safety in states and localities. In Missouri, for example, the fatality rate fell from 5.2 in 1971 to 2.4 in 1988 despite the fact that vehicle miles of travel increased 67.8%, population grew by 405,000 persons, registered vehicles increased by over 1 million, and licensed drivers increased by nearly 800,000 during that same time period. Although many factors have contributed to the decline in the fatality rate, the federal highway safety program has had a lasting and positive impact on traffic crashes in that state.

The 402 program has enabled North Carolina to substantially upgrade its emergency medical services to a point where 88.1% of the most serious injuries were treated by paramedics in FY 89. Before the infusion of federal funds, emergency medical service in the state was little more than a "horizontal taxi" for victims of traffic crashes.

The 402 program has also enabled North Carolina to develop and implement a comprehensive trauma registry. The registry allows the Office of Emergency Medical Services to identify the state's or a hospital's need to expand or decrease various facilities , staff, services, procedures, and equipment. The registry also provides valuable information concerning highway and industrial safety in the state.

We have successfully used 402 funds to leverage local funds for highway safety purposes. This has resulted in sustained local funding of highway safety programs, even after the federal funds are terminated. For example, in Charlotte, a hospital based traffic injury prevention program, working through the local school system, is institutionalizing a safety education program for grades K-12. The program, a model for the country, targets safety issues by season and grade in an organized manner.

Nearly every state can point to successes such as these. Without the federal funds, with shrinking state budgets, and with all the competing demands on state funds, few states would have the necessary resources to devote t highway safety. Highway safety would simply not appear on most states' agenda if it were not for the federal grant programs.

Highway Safety Program Needs

1. Federal Role: We believe that federal highway safety grant programs must be continued and expanded, given the projected future rate of fatalities over the next decade and the past successes which have been achieved as a result of those programs. An expanded federal commitment, along with support by the state and local governments and the private sector, will enable the implementation of improvements across the entire spectrum of highway safety.

We believe that the federal government should continue to provide leadership, as it has done this past year, in establishing highway goals and objectives. This would give the federal highway safety programs clearer direction and purpose and would more closely tie the efforts of the states and localities into a nationally coordinated program. We recommend that goal-setting should be done collaboratively with states, localities, highway safety organizations, and the private sector. We also suggest that the federal government should continue to be responsible for developing standards and criteria for programs and activities which will advance the national goals and objectives.

2. Non-construction highway safety programs: We recommend that the NHTSA 402 program should be continued with no major programmatic changes. Federal funding should continue to be directed to highway safety information and education programs, program evaluation, data collection and analysis, training programs, and enforcement programs. The federal government should continue to set highway safety priorities, but should be required to periodically review those priorities in order to address new and emerging highway safety issues and priorities. States should continue to be allowed to fund programs in non-priority areas.

We do recommend and support the position of the National Association of the Governors' Highway Safety Representatives (NAGHSR); however, there should be some significant structural changes in the 402 program. We believe that the 402 program should be available on a two-tiered basis: a base tier and an incentive tier. The current 402 program should constitute the base tier. The incentive tier should be structured by combining and significantly expanding existing incentive grant programs (408 and 410) to provide financial incentives for a range of priority highway safety issues, including, but not limited to, occupant protection, speed enforcement, impaired development, and uniform data collection and analysis. Base program and incentive funds should be allocated to states according to the current population and road mileage-based formula.

In the first year, a state should be eligible for incentive funds if it qualifies under two or more of the incentive categories. A state should be eligible for subsequent funding if it continues to implement the previous year's program and qualifies under an additional incentive category in each subsequent year. The two-tiered 402 program should be funded at $250 million a year, $125 million in each tier.

Acknowledging the federal budget problem, we hope this committee will support NAGHSR's position that support the incentive approach and strongly oppose sanctions. We believe that sanctions are counterproductive, are usually not targeted to the entity that is responsible for the failure to satisfy the mandated requirement, and generally do not relate to the programs that are being sanction. Incentives, on the other hand, would allow states to satisfy national performance criteria in a manner best suited to their needs and resources and would reward them for actual achievements in highway safety.

We also recommend that the Federal Highway Administration's 402 program should be continued and expanded. Since the proportion of mature drivers is expected to significantly increase in the next decade, funding for this program should be commensurately increased to at least $25 million a year, and the program should be focused more on the roadway safety needs of the mature driver (e.g., improved signage and improved roadway markings). This need has been recognized by Secretary Harrelson, who has ordered

that the Division of Highways begin improving signs and pavement markers along select targeted roadways.

3. Motor carrier safety programs: We recommend that the federal motor carrier safety grant programs (MCSAP and the Commercial Drivers' License Program) should be continued and funded at $100 and $25-50 million a year, respectively. We recommend that the MCSAP program should be adjusted to allow the funds to be used for motor carrier traffic safety enforcement purposes. This would help ensure that motor carriers obey the posted speed limit, do not drive impaired, are properly protected with occupant restraint systems, and comply with the rules of the road.

4. Data collection and analysis: We believe that a national data center should be established for the collection, analysis and dissemination of uniform accident, injury and fatality data. In the long term, the center could integrate into a unified data system registration and licensing information, roadway engineering data, traffic volume data, traffic citation and conviction data as well as other data relating to driver characteristics.

All states collect fatality and accident data and report it to NHTSA through the Fatal Accident Reporting System (FARS). However, the reliability and consistency of the data varies considerably from state to state. Most states have statewide data systems for some injury statistics (such as hospital discharge diagnoses). But not all states support a statewide EMS data system and no state presently supports a statewide computerized hospital emergency department data system. Only a handful of states have attempted to link accident and injury data bases. We are proud to add that North Carolina is one of the states leading the way to link crash data, EMS data, Trauma Regi...y data, Hospital Discharge data, with eventual follow through to rehab facilities.

A national data center could help the states address many of these problems. A center could improve the quality, standardization, and development of data reporting and analysis systems. A center could help states computerize their injury data and could provide technical assistance to states that wish to link data bases. A center could integrate existing data systems into one large unified system. A center could develop training programs to help state and local highway safety personnel in data collection and analysis and in new data processing technology.

5. Highway safety research: We hope that NHTSA's highway safety research efforts under the 403 program will be accelerated. The funds should be used, among other things, to evaluate the effectiveness of existing highway safety programs and countermeasures, to evaluate the effectiveness of vehicle safety standards already in place, and to develop future vehicle safety

standards. Funds should also continue to be used to develop and demonstrate new highway safety program ideas, new countermeasures, and new and advanced highway safety technology

Increased funding should also be provided to FHWA's 403 highway safety research program. The funds should continue to be used to identify roadway improvements which benefit safety. The research program should examine ways to more safely accommodate the changing vehicle mix through traffic control devices and other safety features. Additionally, the program should develop and demonstrate engineering projects which would improve pedestrian and bicycle safety and should address special issues such as the problem of parked vehicles on Interstate access roads.

Financing Federal Highway Safety Grant Programs

Presently, most of the federal highway safety grant programs are funded with revenues from the Highway Trust Fund. It is our feeling that there should be no change in the funding source for these programs.

We strongly oppose efforts to use federal motor fuel tax revenues to support other non-transportation programs or to reduce the deficit reduction. Highway users pay federal gasoline taxes with the expectation that the revenues generated will be used for highway construction, maintenance and safety purposes. By allowing the diversion of federal motor fuel tax revenues, the federal government is violating the user fee principle upon which the federal highway and highway safety programs are based. This sort of diversion also weakens the ability of the Highway Trust Fund to support highway improvement and safety programs at a time when the need for increased investment in our nation's infrastructure and increased spending for safety is becoming more and more obvious. We support efforts to put the "trust" back into the Trust Fund by spending the highway tax revenues for surface transportation improvement and safety purposes only.

Enforcement of the National Maximum Speed Limit

One of the issues which may be addressed in the reauthorization legislation concerns compliance with the national maximum speed limit. Current law considers states out of compliance if more than 50% of a state's motorists exceed the posted 55 mph speed limit. Noncompliant states may be forced to forfeit up to 10% of their primary, urban, and secondary system funds. The sanctions do not apply to the forty states that have increased their speed limit to 65 mph. Furthermore, 55 mph states are required to monitor and report speed data to the Department of Transportation, while 65 mph are not.

This bifurcated approach to compliance has caused two inadvertent, potentially harmful, consequences. For one, it has created a disincentive for states to retain their posted speeds at 55 mph and an incentive for states to raise their speed

limits. Second, it has caused states with some of the lowest fatality rates in the nation to face severe sanction for failing to promote highway safety. The current compliance formula is not working and needs to be altered. I believe most states' Governors' Representatives will agree.

We urge you to address this inequitable situation by:

- requiring all states to monitor and report speeds on all Interstate miles and to submit speed-related statistics to the Department of Transportation. This would generate the necessary data with which to determine whether or not increased speeds adversely impact safety;

- setting the compliance threshold on a state-by-state basis rather than a national basis. This would allow each state to measure progress against itself rather than against neighboring states whose conditions and resources may or may not be similar;

- developing a weighting scheme which would take into account the vehicle miles of travel within each state, the seriousness of the speed violation, the enforcement efforts undertaken by the state, and the relative safety of different types of highways. This would allow the formula to take other factors into account which affect speed compliance;

- giving the states maximum flexibility in the implementation of a compliance program, either by phasing in the compliance threshold over a multi-year period, or by adjusting the threshold by a fixed percentage (e.g., 10 percent) in order to compensate for monitoring and sampling errors, or both strategies. This would give the states the flexibility they need to adjust to a revised compliance formula;

- establishing speed incentives encouraging states to increase and strengthen their efforts to enforce the national speed limit instead of sanctions for failing to enforce it.

This approach is consistent with the one recommended by the Government Accounting Office in its 1988 report to Congress and with the approach that was earlier considered by the Surface Transportation Subcommittee. We believe that it would eliminate the inequities in the current formula while encouraging greater compliance.

Mr. Chairman, this concludes my remarks. I greatly appreciate the opportunity to appear before the Subcommittee and express our views on highway safety reauthorization issues.

Testimony

of the

Virginia Road and Transportation Builders Association

Presented by

Jack Lanford

of

Adams Construction Company

before the

Subcommittee on Surface Transportation

Durham, North Carolina

September 21, 1990

Good afternoon, Mr. Chairman and members of the subcommittee. I am Jack Lanford president of Adams Construction Company , which is based in Roanoke, Virginia. I am pleased to present testimony today before the Subcommittee on Surface Transportation on the transporation needs of this nation.

I am here on behalf of the Virginia Road and Transportation Builders Association (VRTBA) where I am a past president. VRTBA has been providing representation for the transportation construction industry since 1943. VRTBA is affiliated nationally with the American Road and Transportation Builders Association where I currently serve as Senior Vice Chairman.

Mr. Chairman, on behalf of our membership, thank you for allowing VRTBA to provide our views on future transportation needs. Road and highway construction and improvements ranked as the third most important issue to state legislatures and their staff behind tourism and agricultural environment.

At the outset, I will say that we believe that the financial decisions that the U.S. Congress makes next year in the transportation area will have a direct impact on the nation's economy and well-being long into the future. But first we must ensure that the federal highway user fees are not raised for non-transportation purposes, including to help balance the federal budget. The Highway Trust Fund along with the federal gasoline and diesel excise tax was established to SOLELY fund the construction and repair of our highway and bridge system. Diverting these funds would severely impact the ability of federal and state governments to meet identified infrastructure needs.

America is built on mobility. Its vast size places a high value on the ability to move people and goods over both short and long distances in an economical and efficient manner. The American highway system, developed jointly by the federal and state governments, has had more to do with our quality of life and economic prosperity than any other single factor.

The efficiency of our highway system also has a direct affect on productivity. It is documented fact that countries that sustain a high level of public investment relative to output experience highway productivity growth.

During the past two decades, Japan has invested about 5 percent of its output in public works and achieved an annual productivity growth of over 3 percent. The West German experience is similar.

The United States, meanwhile, has maintained a low public investment ratio of three-tenths of a percent and seen inferior productivity growth just six-tenths of a percent per year. The fact is, the United States ranks 55th in the world in public capital investment. To me, that is a national embarrassment. It is also a sure prescription for economic decline.

Today, America's federal highway system—the backbone of our national economy—is in serious trouble.

While this network of highways and bridges comprises only 22 percent of the nation's total road mileage, it carries 81 percent of all travel—more than 1.6 trillion miles per year.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the federal-aid system are either "structurally deficient" or "functionally obsolete." The same report states that more than 40 percent of the pavements on the federal-aid system are in "poor" or "fair" condition.

This 1989 report and the Federal Highway Administration's 1988 publication, America's Challenge For Highway Transportation In The 21st Century, both state that meeting existing capital needs on the federal-aid system alone requires a $40 billion per year investment in transportation construction projects—a rate of spending substantially in excess of the current obligations for the Federal-aid Highway Program.

Meeting these quantified needs on the federal-aid system is one of the major financial challenges facing the nation. Failure to provide an adequate and useable highway system will have a profound effect on the quality of American life, our economic growth and development, and our ability to meet national defense requirements.

The Federal-aid Highway Program has been a driving force behind building a better America. The reauthorization of this federal program should foster continued opportunities for growth and development.

If the program's reathorization legislation does not address known needs in a meaningful way, the deterioration of the Federal-aid Highway System, which is becoming more apparent every day, will continue, placing the American economy in danger. Today, highway disrepair and congestion are contributing to increased economic costs, air pollution and wasted energy resources.

According to federal statistics, the nation now wastes 1.25 billion hours and 1.38 billion gallons of motor fuels due to congestion on limited access highways each year. By the year 2005, that waste could soar to 6.9 billion hours in lost productivity and 7.32 billion gallons of squandered fuel.

Economists at the U.S. Department of Transportation estimate that if our highways are allowed to continue to deteriorate, by 1995 the U.S. economy could potentially miss out on increases of 3.2 percent in Gross National Product (GNP), 5.9 percent in disposable income, 2.2 percent in employment and 2.7 percent in manufacturing productivity.

Disinvestment caused much of our current problem . Total public capital expenditures for highways and bridges has dropped from 1.4 percent of GNP in the early 1960s to about 0.5 percent today. During this same period, traffic on the Federal-aid Highway System has increased five fold.

What should be done? The solution to our highway problem is obviously: we must begin investing in the future. Providing adequate resources is the key.

One alternative is to spend the current cash balance in the Highway Account of the Highway Trust Fund to address the call for greater highway improvement expenditures. But how far will that $10 billion balance go?

An examination of the language of the Highway Revenue Act authorizing the Highway Trust Fund shows that deficit spending in this fund is prohibited. Since the entire balance cannot be spent, the portion that is available, between $5 and $8 billion, will not significantly increase the current program.

The Virginia Road and Transportation Builders Association believes the federal reauthorization bill should provide $40 billion per year for highway and bridge improvements. This authorization level should commence in 1992 and continue for a minimum of five fiscal years thereafter. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation referred to earlier in our testimony.

To authorize and carry-out a program of this magnitude, we are recommending that the U.S. Congress:

• Ensure that all federal highway user fee revenue contributed to the Highway Trust Fund—plus interest earned on that money—is spent in a timely manner. A drawdown in the trust fund's current $10 billion-plus cash balance should begin during the next fiscal year.

• Remove the Federal-aid Highway Program from the Unified Federal Budget in order to ensure that revenues are not impounded or withheld in the future.

• Increase the federal highway user fees—effective in fiscal year 1992—to raise the additional $25 billion per year that is necessary for a $40 billion per year federal program of highway improvement assistance.

• No longer impose artificial obligation ceilings on the expenditure of federal highway funds.

• Repeal the current six cents-per-gallon federal tax exemption on gasohol sales for highway vehicle usage (which causes an estimated $500 million per year loss to the Highway Trust Fund); and

• Tighten federal highway motor fuels collection procedures.

These actions would assure that future generations have a highway system on which they can build. The historic role of the federal government in the development and upkeep of a national highway network should be maintained.

Recently, David Alan Aschauer, a senior economist with the Federal Reserve Bank of Chicago, and Richard Mudge, the former head of the Congressional Budget Office's Public Investment Unit, quantified the long-term national economic impacts of such a proposed program. Their findings are dramatic:

• By the year 2012, national productivity would be 7.7 percent higher, resulting in an additional $400 billion per year in Gross National Product; and

• The expected productivity gain would generate an additional $29 billion per year in corporate profits and a $35 billion annual increase in private investment. That is an excellent return on your investment.

There is no question that the federal government has a clear role to play in the development and upkeep of a national system of highways and bridges. The federal responsibility is defined by the Constitutional mandates to regulate commerce among the states and with other nations, provide for the national defense, and safeguard the public health.

The user fee principle that has guided the financing of our national highway transportation program has contributed to its success. Highway users recognize the importance of well-maintained highways and bridges. They also realize that continued expenditures must be made in order to maintain system performance at an acceptable level. Over the years, motorists have shown a willingness to pay appropriate user fees —if they are used for their intended purpose.

Consistent with our recommendation for increased funding, VRTBA also believes that the working partnership between the federal government and the states, which is the basis of the existing federal-aid program, must be continued.

Some have suggested that state and local governments should be responsible for raising revenue to meet future needs for rebuilding and expanding our highway system. In fact, over the last 20 years, federal support for improvements has declined over 20 percent in constant dollars.

While the federal interest has continued, state governments have worked to increase state revenues for highways to keep the system from further deterioration.

Now is the time to re-establish the true meaning of the federal-aid highway partnership and to live up to the federal commitment to adequately fund improvements on highways and bridges significant in meeting transportation responsibilities.

The unwillingness of the federal government to raise and spend sufficient funds to maintain system performance has resulted in a program that is not fully meeting identified needs. Now is the time for bipartisan leadership in this area if we are to meet our future transportation demand

IT'S AN !NVESTMENT IN THE FUTURE

America is literally at a crossroad. We can continue to ignore our serious and growing highway and bridge problems. Or we can choose to make the investment —about $40 billion per year—that is necessary to rebuild and expand our national highway network to meet future demands.

Good roads save lives. Improve productivity. Enhance competitiveness. And reduce pollution-causing, energy-wasting traffic congestion. In short, they're an investment in the future.

Together, let's build a better America through transportation. The time to act is NOW!

Thank you for the opportunity to present the views of the Virginia Road and Transportation Builders Association on our future highway needs. I stand ready to answer any questions that you may have.

Comments & Support Documentation

September 21, 1990

WELCOME TO NORTH CAROLINA, I AM INDEED HONORED TO BE ALLOWED TO ADDRESS YOU ABOUT TRANSPORTATION CONCERNS NOT ONLY IN GREENSBORO BUT CONCERNS THAT HAVE BEEN SHARED TO ME BY FELLOW COUNCIL MEMBERS IN NORTH CAROLINA AND THROUGHOUT THE NATION.

WHY ARE YOU HERE?

YOU ARE HERE BECAUSE CONGRESS IN 1956 PASSED ENABLING LEGISLATION TO CREATE THE INTERSTATE HIGHWAY SYSTEM. COINCIDING WITH THE COMPLETION OF THAT INTERSTATE SYSTEM ALL FEDERAL HIGHWAY AND MASS TRANSIT PROGRAMS AND SUPPORTING HIGHWAY TRUST FUNDS WILL EXPIRE ON SEPTEMBER 30, 1991.

A LITTLE OVER ONE YEAR FROM TODAY.

THIS PROCESS WILL TAKE YOU TO FIVE OTHER STATES.

THE LANDSCAPE WILL CHANGE BUT THE QUESTIONS AND CONCERNS WILL REMAIN THE SAME.

PLEASE LISTEN CAREFULLY TO THOSE CONCERNS AS YOU TRAVEL. MANY IDEAS WILL BE OFFERED AND NEED TO BE CONSIDERED BEFORE YOU FINALIZE A NEW TRANSPORTATION POLICY FOR OUR COUNTRY.

WHY AM I HERE?

I AM HERE TODAY TO ADDRESS SOME CONCERNS THAT OUR CITY AND MANY OTHER CITIES IN NORTH CAROLINA AND THROUGH OUT THE UNITED STATES SHARE.

AMERICA HAS ONE OF THE MOST COMPREHENSIVE SURFACE TRANSPORTATION SYSTEMS IN THE WORLD.

BUT THE CLOCK HAS BEEN RUNNING ON OUR SYSTEM.

NORTH CAROLINA ALONE HAS OVER 78,000 MILES OF STATE MAINTAINED ROADWAYS. THIS IS THE LARGEST STATE MAINTAINED SYSTEM IN THE COUNTRY.

SOUNDS IMPRESSIVE BUT LISTEN FURTHER.

SINCE 1960 WE HAVE INCREASED OUR NUMBER OF LICENSED DRIVERS BY 55%;

VEHICLE REGISTRATIONS HAVE INCREASED BY 95%;

AND OUR VEHICLE MILES TRAVELED HAS INCREASED BY 168%.

ALL THESE CHANGES AND OUR HIGHWAY SYSTEM HAS ONLY INCREASED BY ONLY 9%.

WHAT ABOUT OUR LOCAL TRANSPORTATION SYSTEM.

IN GREENSBORO WE HAVE BEEN PLANNING THOROUGHFARES SINCE 1954.

OUR 1954 PLAN WAS ONE OF THE FIRST IN THE COUNTRY.

LAST YEAR WE APPROVED OUR NEW THOROUGHFARE PLAN. THIS PLAN REFLECTS MANY CHANGES THAT ARE TAKING PLACE IN OUR SOCIETY.

LET ME REVIEW SOME OF THE CHANGES GOING ON IN MIDDLE AMERICA.

OUR DOWNTOWNS HAVE SHRUNK BUT ARE MAKING A COMEBACK.

OUR MERCHANTS HAVE MOVED TO REGIONAL MALLS OR WORSE STRIP SHOPPING CENTERS ALONG OUR MAJOR STREETS.

MANY OF OUR CITIZENS HAVE FOUND THE AMERICAN DREAM.
THAT DREAM IS TWO PLUS CARS PARKED IN FRONT OF A HOUSE ON A CUL DE SAC IN A SUBDIVISION 10 TO 30 MILES FROM THE SUBURBAN CENTERS WHERE THEY WORK.
THE FASTING GROWING TYPE OF TRIP IS NOW THE SUBURB TO SUBURB COMMUTE.
OUR TRANSIT SYSTEMS ARE STAGNANT, NON EXISTENT OR ARE FAILING US.
OUR VEHICLE OCCUPANCY LEVEL HAS DROPPED TO 1.2 PERSONS PER CAR.
WE HAVE AN INTERSTATE HIGHWAY IN OUR CITY CARRYING OVER 106,000 CARS A DAY IN A CITY WITH A POPULATION OF AROUND 190,000 PEOPLE.
WE KEEP BUYING MORE CARS AND MOVING FURTHER OUT OF TOWN.
NOT ONLY IS OUR TRANSPORTATION SYSTEM STRETCHED TO THE LIMIT SO ARE OTHER MUNICIPAL SERVICES SUCH AS FIRE, POLICE AND CLEAN WATER.

HOW DID WE GET HERE? CAN WE CHANGE?

CHANGE CAN BE DRAMATIC SUCH AS THE OIL EMBARGO OF 1974.
OR CHANGE CAN BE AS SUBTLE AS THE CREATION OF A VAN SHUTTLE SERVICE. THE DECISIONS THAT YOU MAKE OVER THE NEXT YEAR WILL CAUSE A CHANGE IN THAT PATTERN.

I DID NOT COME HERE TODAY TO TELL YOU ONLY ABOUT THE PROBLEMS IN CITIES LIKE GREENSBORO.

WE HAVE SUCCESS STORIES TO SHARE WITH YOU ALSO.

THANKS TO A BROAD COMMUNITY BASED CITIZEN EFFORT THAT FOCUSED ON TRANSPORTATION AS WELL AS FOUR OTHER CRITICAL AREAS. OUR CITIZENS PASSED IN 1988 A $75 MILLION TRANSPORTATION BOND PROGRAM. THIS WAS THE LARGEST TRANSPORTATION BOND PROGRAM IN THE STATE AT THAT TIME.

WE HAVE ALSO AS A COMMUNITY BEGUN TO FACE UP TO THE FACT THAT WE CAN NOT CONTINUE TO BUILD HIGHWAYS.

WE HAVE TAKEN MAJOR INITIATIVES IN PUBLIC TRANSPORTATION THANKS TO CITIZEN EFFORTS, STAFF ASSISTANCE AND GUIDANCE FROM NCDOT PUBLIC TRANSPORTATION AND UMTA.

TODAY I HAVE THREE SIMPLE POINTS TO FOCUS YOUR ATTENTION ON. THE FIRST POINT IS

PRESERVATION:

WE MUST PRESERVE WHAT WE ALREADY HAVE.

WE HAVE ESTABLISHED A TRANSPORTATION SYSTEM THAT CAN NOT BE REPLACED.

WE MUST PRESERVE THAT VALUABLE COMMODITY.

WE MUST APPLY THE NECESSARY FUNDS TO ENSURE THAT OUR HIGHWAYS, BRIDGES, RAILROADS, AND OTHER TRANSPORTATION RESOURCES STOP CRUMBLING AND BE REESTABLISHED TO SERVE FUTURE GENERATIONS.

I DO NOT NEED TO QUOTE TO YOU THE NUMBER OF HIGHWAYS THAT ARE CRUMBLING BEFORE OUR EYES OR THE NUMBER OF UNSAFE BRIDGE THAT ARE BEING USED EVERY DAY BY TRAINS, CARS AND SCHOOL BUSES.

FUNDING DOES NOT COME EASY BUT OUR POLICY MUST ADDRESS PRESERVATION AND IT MUST BE REALISTIC AND FAIR.

MY NEXT POINT IS

COMBINE:

WE MUST INCREASE OUR FUNDING BY COMBINING OUR RESOURCES.

WE AT THE LOCAL LEVEL REALIZE THAT THE FEDERAL GOVERNMENT CAN NOT SOLVE ALL OUR PROBLEMS.

SURVEYS SHOW THAT OUR SOCIETY BELIEVES IT IS UNFAIRLY TAXED.

WE ALL KNOW THAT THE FAIREST AND MOST EQUITABLE TAXES ARE USER BASED TAXES.

YOU WILL BE PRESSURED TO LOOK AT MANY FUNDING PROGRAMS BUT EXAMINE EACH CAREFULLY.

BE RESPONSIBLE AND FAIR OUR FUTURE DEPENDS ON IT.

BEING RESPONSIBLE AND FAIR INCLUDES ALLOWING LOCAL AND STATE GOVERNMENTS TO DETERMINE THEIR OWN PRIORITIES AND APPLICATION OF FUNDS.

LOCAL COMMUNITIES STAND READY AS I BELIEVE DO STATE GOVERNMENTS TO BE PARTNERS IN FUNDING OF HIGHWAY, TRANSIT AND OTHER TRANSPORTATION NEEDS IN AN OPEN FAIR AND RESPONSIBLE MANNER.

WE KNOW THAT NONE OF US CAN DO IT ALONE.

MY FINAL POINT IS THAT WE MUST MAXIMIZE OUR TECHNOLOGY:

IN ORDER TO SOLVE OUR TRANSPORTATION PROBLEMS WE MUST PURSUE NEW TECHNOLOGY.

IN GREENSBORO WE ARE CREATING A PUBLIC PRIVATE PARTICIPATION SYSTEM OF MASS TRANSIT. THIS COMPREHENSIVE PLANNING METHOD OF PUBLIC TRANSPORTATION CAN BE APPLIED TO OTHER AREAS OF THE COUNTRY.

WE HAVE ALSO BEGUN THE FORMATION OF A REGIONAL TRANSPORTATION PLANNING ORGANIZATION WITH OUR NEIGHBORING COMMUNITIES OF HIGH POINT AND WINSTON SALEM.

WE HAVE FOUND THAT OUR PROBLEMS ARE SIMILAR.

NOW WE ARE SEARCHING FOR COMMON SOLUTIONS.

ONE COMMON PROBLEM IS AIR POLLUTION THAT WE ARE WORKING TOGETHER TO DEVELOP MEASURES TO ASSIST EACH OTHER IN SOLVING.

GREENSBORO AND HIGH POINT HAVE JOINED TOGETHER TO FUND PLANNING STUDIES CONCERNING REGIONAL HIGHWAY PROJECTS.

WE HAVE CREATED A INTERCITY SHUTTLE BETWEEN GREENSBORO AND HIGH POINT. THAT SINCE ITS CREATION IN JANUARY OF THIS YEAR IS APPROACHING CAPACITY.

THIS SERVICE IS AN INCUBATOR THAT WILL ONE DAY LEAD TO SCHEDULED BUS SERVICE BETWEEN GREENSBORO, HIGH POINT AND WINSTON SALEM.

WE HAVE ONE OF THE MOST SUCCESSFUL RIDESHARING PROGRAMS IN THE COUNTRY.
MUNICIPOOL HAS BEEN RECOGNIZED BY MANY PUBLIC TRANSPORTATION GROUPS AS BEING INNOVATIVE AND EFFECTIVE AT A SMALL COST TO THE TAXPAYERS.

OUR PLANNING EFFORTS HAVE BEEN IMPORTANT IN THE PAST AND WILL BE EVEN MORE IMPORTANT IN THE FUTURE.
THESE ARE JUST SOME OF THE THINGS THAT WE NEED TO CONTINUE TO DO AND GROW ON.
WE FEDERALLY, STATE AND LOCALLY NEED TO FIND AND FUND NEW AND INNOVATIVE TRANSPORTATION APPLICATIONS THAT ARE DIVERSE AND FIT AN AREAS NEEDS AND THE NEEDS OF ITS CITIZENS.
TRANSPORTATION PLANNING HAS COME A LONG WAY SINCE THAT 1954 PLAN. WE NOW USE COMPUTERS AND MODELING PACKAGES THAT TELL US HOW EFFECTIVE DIFFERENT IMPROVEMENTS ARE.
THE QUESTION NOW IS WILL THE FUNDING BE THERE TO IMPLEMENT THOSE IMPROVEMENTS TO OUR STREETS, ROADS, HIGHWAYS, AND BUSES SYSTEMS.

IN CLOSING REMEMBER:
PRESERVATION OF OUR SYSTEMS
COMBINE OUR FUNDING EFFORTS
PURSUE NEW TECHNOLOGY

THANK YOU FOR THIS OPPORTUNITY.

LET US LEAVE HERE TODAY WITH A CLEAR UNDERSTANDING WHAT NEEDS TO BE DONE.

NOW IT IS UP TO YOU AND YOUR COLLEAGUES TO PROVIDE US WITH A PROGRAM THAT WILL TAKE OUR NATION INTO THE FIRST HALF OF THE 21ST CENTURY.

3305

Moving America

New Directions, New Opportunities

Volume 1: Building the National Transportation Policy

U.S. Department of Transportation

I. America Needs a National Transportation Policy

"Our unity as a nation is sustained by free communication of thought and by easy transportation of people and goods . . . Together, the uniting forces of our communication and transportation systems are dynamic elements in the very name we bear—United States. Without them, we would be a mere alliance of many separate parts."

President Dwight D. Eisenhower,
Message to Congress,
February 22, 1955

The Role of Transportation

America's unity and vitality are inextricably entwined with the growth of transportation. Throughout our history, transportation has linked farms to markets, oil wells to refineries, factories to consumers, homes to workplaces, and people to academic, cultural, and recreational activities.

Transportation has been, and continues to be, a powerful engine for America's economic growth. Some of mankind's greatest advances have been possible only because developments in transportation opened a wider range of resources and economic opportunities. For over 200 years, the ever-increasing expansion of our transportation network of roads, canals, railroads, and airways has stimulated the specialization of economic activity and tied the country together.

Almost one of every five dollars spent on goods and services in our economy—equivalent to 18 percent of America's gross national product—is spent on transportation products and services. Our transportation system handles 3.5 trillion passenger-miles and 3.4 trillion ton-miles of freight annually. Transportation and transportation-related businesses employ one-tenth of America's workforce. Annual expenditures for transportation products and services in the United States total nearly $800 billion.

Key Concerns

Will today's transportation policies and infrastructure meet tomorrow's needs? Indeed, how well are we meeting today's needs?

Over the past decade at least a dozen major studies have been published which try to answer these questions and develop a transportation agenda for the future. Currently, assessments are underway by the National Governors Association, the Congressional Office of Technology Assessment, and the American Association of State Highway and Transportation Officials, the last in concert with over 100 public and private organizations. The impetus for these efforts includes the following:

Infrastructure	Transportation infrastructure is wearing out, to the extent that the National Council on Public Works Improvement has called for doubling our investment in public infrastructure by the end of the century.
Safety	There continue to be too many transportation accidents and fatalities. The problem is greatest on highways, where there were 47,000 deaths in 1988. The figure could rise dramatically as highway traffic doubles by the early part of the next century.
National Security	The continuing decline in our maritime capability, the growth in terrorism and drug smuggling, and the shortcomings of our transportation infrastructure threaten our national security.
International Trade	International commerce and travel are growing at unprecedented rates. America must have a transportation system that can bring people and goods to the global marketplace quickly and at competitive prices. European and Asian nations are pursuing transportation innovations that—if unchallenged—will give them an edge.
Growth in Demand	Growth in demand for transportation services parallels economic activity. Even modest annual travel growth rates will add up to an enormous increase in traffic over the next 30 years. Without swift action to handle the demand, congestion will grow to intolerable levels, especially on highways and at airports.
Equity and Access	As a nation, we would like all Americans to enjoy the benefits our transportation system provides. Yet some Americans—especially elderly, disabled, and low income travellers—have special transportation needs that are unmet.
The Environment	Transportation has been a major contributor to the nation's environmental problems, with increasingly serious implications for the future. Key concerns include air pollution by automobiles and trucks, aircraft noise around busy airports, hazardous materials transportation and storage, and oil spills.
Dependence on Foreign Oil	The nation is likely to face a doubling in constant-dollar world oil prices by the year 2000. According to the Department of Energy, the percentage of oil we import may rise from 37 percent today to 55 percent in 2000. Alternative fuels will take time to be readily available at competitive prices.
Budgetary Constraints	Fiscal constraints at all levels of government and competing demands for public funds require that transportation programs be well-justified and widely supported. Investments with long-term payoffs are vulnerable to delay or curtailment when more immediate demands are pressing.

Advancing America's Goals Through Transportation

Transportation plays a vital role in advancing America's national goals. A responsive, well-maintained, and efficient transportation system can further:

- **economic growth**
- **our competitiveness in the global marketplace**
- **national security**
- **a better quality of life for every citizen**

America needs a national transportation policy that will help meet these national goals. The policy must be a strategic approach based on cooperative public and private action. It must link transportation objectives to America's national goals and delineate the respective roles of government and the private sector in moving toward those objectives. The policy must lead ultimately to a transportation system with the following characteristics:

The system must satisfy the mobility needs of individuals and businesses.

It must offer sufficient capacity, without being overbuilt.

It must be safe, reliable, and energy efficient.

It must be efficiently maintained, operated, and managed.

It must be low in cost and priced so that, with few exceptions, users bear costs proportionate to their use.

It must co-exist in harmony with the environment.

It must be receptive to new and improved technology.

Developing and implementing such a national transportation policy will be no easy job. It will require vision, sacrifice, and the cooperation of all levels of government, business, labor, and transportation users.

Above all, in developing the policy, we must think and plan strategically. Businesses rely on strategic planning to think ahead, prioritize, and position themselves for the future; government policy—transportation policy—must be driven by strategic thinking as well.

A Strategic Approach to Developing the National Transportation Policy

America's transportation policy must be, perhaps more than anything else, a balancing of local and national needs, government and private roles, capital and non-capital management strategies, cost and accessibility, reliability and efficiency, and growth and environmental quality. It must incorporate many different objectives.

- **The policy should be flexible in responding to emerging transportation needs.**

  It should encourage a flexible allocation of transportation resources in order to address complex needs—foreseen and unforeseen—that often require multi-modal solutions. It should also breathe flexibility into the institutions and processes that shape transportation in order to eliminate barriers to innovative solutions and improvements.

- **The policy should be market-driven.**

  It should lead to transportation systems that are organized to meet market needs and responsive to changing demographic and travel patterns. It should employ market demand in determining the level of, and assigning a priority to, a system's investment requirements.

- **The policy should be performance-based.**

  It should direct investments toward solutions that provide the greatest benefits to the public. It should provide guidance on how transportation choices can best advance America's national goals.

- **The policy should promote balanced and integrated transportation solutions.**

  It should lead to investment strategies that fully consider public priorities and carefully weigh competing transportation investment options. A balanced approach recognizes the advantages provided by each mode of transportation, the benefits that can be derived from intermodal linkages, and the appropriate application of technology.

The Urban/Suburban Market

Today

The population and economic activity of America are increasingly concentrated in metropolitan areas, particularly large metropolitan areas. Suburbs surrounding central cities are absorbing most metropolitan growth. **The urbanization of America has placed increasing demands on urban transportation systems. Urban traffic loads continue to increase and travel between suburbs continues to grow in importance.**

Urban/Suburban Commuting Trips, 1960–1980

Source: Commuting in America, Eno Foundation

- **Three quarters of the 250 million trips made by Americans each day are made in metropolitan areas. Over 80 percent of these trips are made in private motor vehicles.**
- **Increasing suburban development and the shift of homes and jobs away from central cities has led to greater dependence on the private automobile, challenging traditional transit service and creating a new pattern of commuting flows. In some large cities, transit systems handle a large portion of daily work trips.**
- **Freight moving into and out of cities is carried, in large part, by heavy trucks, with smaller trucks and vans used for local delivery. Although essential to urban economic activity, trucks traveling within, or through, urban areas contribute to urban transportation problems, including congestion, pollution, greater safety risks, and physical deterioration of facilities.**
- **Many major cities are the sites of port facilities and airports that serve as points of entry or exit for cargo distributed or gathered throughout a broad area.**

The most prominent shortcomings of the urban transportation system are urban and suburban congestion, lack of good alternatives to the automobile for people needing or wanting them, and the environmental problems associated with vehicle use. Despite the heavy travel demand in urban areas, there has been relatively little investment in new physical capacity for over a decade, leading, in the views of many, to an underinvestment in urban transportation capacity. A number of approaches have been taken to improve urban transportation, including:

- expanded transit service by bus, rail, or publicly-operated vanpools offering flexible service to meet individual needs
- programs to stimulate private sector participation in transit services
- ridesharing and high-occupancy vehicle lanes
- addition, on a limited basis, of new freeway and arterial lanes

Tomorrow

Transportation systems that serve the urban/suburban market are in danger of becoming victims of their own success. Urban transportation systems have been instrumental in fostering the growth of metropolitan America, but increasing concentrations of commercial and industrial activity in metropolitan areas and continued growth in suburb-to-suburb commuting are straining limited urban transportation capacity. Travel delays in the nation's largest urbanized areas now cause nearly 2 billion lost person-hours annually.

A DOT study has estimated that travel delays in metropolitan areas in the early 21st century may be several times greater than they are today, unless aggressive efforts are made to respond to urban traffic growth. These efforts may include, among other things, advanced driver information systems that make more efficient use of streets and highways and long range plans and financing to maintain or manage existing capacity, as well as to preserve the transportation corridors needed for major new facilities.

Major Issues Facing the Urban/Suburban Market

Those who have a stake in metropolitan transportation face several critical issues in coming years:

- **Congestion.** To what extent does congestion in the urban/suburban market stifle economic growth? What course of action should local, state and federal governments pursue to reduce congestion and delays? What should be expected from the private sector? What role should land-use planning play in addressing congestion and growth in demand? How effective is public transportation in reducing congestion? What can technology reasonably contribute to managing traffic more effectively? What additions to capacity would be most cost-effective? How responsive are local, state, and federal decisions to changes in metropolitan travel patterns, especially the trend toward more suburban-to-suburban travel?
- **Infrastructure Financing.** How much should we invest to maintain and improve highways, bridges and public transit facilities in urban/suburban areas? How can we ensure that investment is directed wisely and that financing decisions balance competing priorities—capacity expansion versus rehabilitation, urban

38-253 O—91——105

highways versus mass transit? What share of the burden of financing urban transportation improvements should be borne by local, state and federal governments and the private sector? How should public costs be allocated among users? To what extent could innovative financing techniques, including developer's fees, contribute?

- **Special Transportation Needs.** How can metropolitan transportation networks better respond to the special needs of elderly, disabled, and low-income travellers? What role can public transportation play? Who should bear the cost of such services?
- **Environment.** What are the most effective and acceptable ways to reduce harmful vehicle emissions in severely polluted cities? How can we balance the conflicting demands for a quality urban environment with the need for responsive, inexpensive transportation?
- **Safety.** What measures will do the most to improve safety for users of urban transportation systems and for pedestrians? How much will they cost? What is the safety potential of "smart motor vehicles/smart highways"? Are there other technological innovations on the horizon that can improve transportation safety in urban areas?

COMMUTING IN AMERICA

A National Report on Commuting Patterns and Trends

Prepared by Alan E. Pisarski
Under Direction of The Steering Committee
for the National Commuting Study

ENO FOUNDATION FOR TRANSPORTATION, INC.

Executive Summary

Most of the images we have of commuting come out of the fifties and sixties and, while still applicable to many people, have been superseded in importance by new patterns of travel, everywhere but in the public mind.

This document describes these new patterns, seeking to update our image of commuting. It is intended as an objective, factual resource to support the activities of those in the public and private sectors whose responsibilities are impacted by the changing demands of commuting. It is hoped that by providing a solid base upon which to build an understanding of contemporary commuting that a more informed public discussion will occur and more responsive public policies will result.

MAIN THEMES

The statistical picture presented in this document is extensively detailed in order to adequately capture not only the "what" of present commuting trends, but also the "why." While this is essential to a comprehensive understanding of the subject, it also risks losing the reader in a maze of detail. To assist the reader in maintaining a clear perspective, the three primary themes permeating the detailed analyses are capsulized in this summary. These themes represent the central elements in a sophisticated understanding of the present character of commuting, how it has evolved into its present form, and where it is going.

1. ***The Worker Boom***—There have been dramatic increases in the numbers of workers, and therefore in the numbers of work-trip commuters. This has occurred to a much greater extent than population growth trends would indicate.

2. ***The Suburban Commuting Boom***—Jobs have tended to locate in the suburbs, following behind the population shift to the suburbs. This has made suburb-to-suburb commuting the dominant national commuting pattern.

3. ***The Private Vehicle Boom***—Use of private vehicles, whether they be autos, vans, or light trucks, has expanded the predominance of private vehicles as the means of travel to work.

Figure A depicts these main themes and their constituent elements. Although there are many important sub-themes, some contributing to the main themes, others acting in separate ways, these three: the worker boom; the suburban commuting boom; and the boom in the use of private vehicles for the work trip, are the main elements in the contemporary commuting story. The major forces of change that define and characterize these themes are summarized below.

The Worker Boom

The American worker boom, occurring since the end of World War II, dwarfs the well-known postwar "baby boom." From 1950 to 1980 the employed civilian labor force grew by more than 65%, while population grew by about 50%. The increase in employment of almost 40 million also meant an increase of nearly 40 million commuters.

In recent years the pace has accelerated. By 1970 population growth had begun to taper off, coming down to an annual growth rate of approximately 1%

Figure A. Main themes of change influencing commuting in America today

a year up to the present. Corresponding employment growth accelerated in the seventies and eighties and now is growing at about twice the rate of population. Thus, total workers and, therefore, total commuters, which had grown to 100 million in 1980, reached 110 million by mid-summer 1986. Figure B depicts the main elements in the worker boom.

The boom in commuters necessarily has two parts—rapid growth in the number of jobs available, and accompanying growth in people of working age to fill the jobs. America has had both, particularly since the seventies.

It is beyond the scope of this undertaking to fully document and explain the boom in jobs generated by the U.S. economy. For our purposes it is sufficient to recognize that the economy has provided a dramatic expansion in jobs, far exceeding job creation in the other market economies of the world.

A major part of the explanation of where the labor force came from in such great numbers is the so-called "baby boom." Another significant reason for labor force growth has been the unprecedented numbers of women entering the labor market. Figure B depicts the major elements influencing the shift away from traditional work-force patterns.

- Between 1960 and 1980 the working-age population increased by 40 million, a rate of increase of 38% compared to an overall population growth of 26%.
- In 1960 the first of the baby-boomers had reached labor force age. By 1980 they represented more than 42% of the U.S. labor force.
- More than twice as many people entered the working-age group between 1970 and 1980 as did in the 1950 to 1960 period.
- The baby-boomers, a "bubble" in the age distribution of the population, working its way through the life cycle, will dominate the working population's character well into the next century.

While the baby boom is the major explanation for the large leap in the proportion of the population of working age, the jump in the proportion of the working age group actually entering the labor force is wholly a product of women entering into the job market in extraordinary numbers.

- In 1950 about one-third of working-age women were in the labor force. By 1985 that figure had jumped to almost two-thirds.
- Of the 50 million new entries into the labor force since 1950, 30 million were women.
- Women represented only 28% of the labor force in 1950; today they exceed 44%.

Figure B also illustrates dramatic growth in the numbers of women in the labor force. A key concern for the future is the need for better understanding of the travel characteristics of women commuters. Their commuting characteristics, significantly dif-

Figure B. Factors influencing the worker boom

ferent from male travel characteristics in the past, have recently begun to display patterns more like those of male workers.

The effects of the rapid growth in workers are not easily reckoned. The most obvious is that there are far more commuters today than expected based on historical relationships to population, with all that this implies about strains on public facilities, congestion, etc. An important aspect of the commuter growth pattern has been that it has occurred in slow population growth areas as well as fast growing areas.

- In those metropolitan areas experiencing very high rates of population growth in the seventies, the growth in workers was far in excess of the population growth rate. Phoenix, the fastest growing large metropolitan area in the nation, increased in population by 55% between 1970 and 1980—worker increase was 80%, 25 percentage points higher.
- In those areas incurring very low rates of growth, or even declines in population, growth in commuters was still very substantial. The Washington metropolitan area population increased by only 5%. Yet the commuter population grew by 24%, about 20 percentage points higher.
- All eight of the large metropolitan areas that lost population in the seventies gained workers. Buffalo, the slowest growing large metropolitan area, lost 8% of its population, yet showed a worker increase of 1%.

Figure C. Factors influencing the suburban commuting boom

tan form, having the potential for substantial influence on the scale and character of future commuting demand. Of course, closer balance in the numbers of jobs and workers in a given community does not assure that commuting will be minimized. Substantial in-bound and out-bound flows, depending on the nature of actual jobs and the skills mix of workers in a community, will remain a characteristic of communities.

Changing Metropolitan Commuting Patterns. Changes in commuting flows reflect the new job and worker location patterns. Metropolitan and suburban growth trends vary with size of metropolitan area. The same is true for commuting patterns. It is in the largest metropolitan areas where the suburbs are most dominant in commuting patterns. In smaller metropolitan areas, the suburb-to-central city and intra-central city trips are greater as a proportion of all work trips. Thus, almost a contradictory pattern exists, wherein the smaller central cities are more dominant in their regions than are the larger cities. In these smaller areas, the stronger orientation to the center may still exist because congestion in the center may not have reached levels high enough to create pressures for alternative suburban development, nor may the critical mass exist needed to support satellite development. Despite this variation in importance of the different flows by size of area, the relative growth rates by size do indicate that the suburbanization of jobs and commuting flows is widespread, affecting work travel patterns in all metropolitan size categories.

- The predominant commuter flow pattern is now the suburb-to-suburb trip. At about 25 million commuter trips per day, it represents about one-third of all metropolitan commuting.
- The traditional commute between suburb and center city, although still growing, is not the dominant pattern. It is in fact third, behind central city-to-central city trips.
- The majority of work-trip growth, 58%, occurred in suburb-to-suburb commuting. Suburb-to-center city commuting accounted for 25% of the growth, and central city based trips, those going to the suburbs and those destined to other parts of the central city, each accounted for about 9% of the total growth in commuting between 1960 to 1980.
- Work travel between metropolitan areas is becoming a significant element in commuting patterns as suburbs overlap. Metropolitan areas exchange about 3.7 million workers each day. All of these trips pass through at least two suburban areas and about 55% have their destinations in a suburb.
- Travel to work between metropolitan areas and non-metropolitan areas is also of growing impact. About two million commuters enter metropolitan areas each day from non-metropolitan areas while about a million leave the area to work in non-metropolitan areas. All of these trips must traverse the suburbs adding to suburban traffic congestion.
- There are now over 700 non-metropolitan counties, with a population of about 20 million, sending 5% or more of their workers to the central counties of metropolitan areas each day.

Shifts in commuting patterns also have generated significant changes in commuting trip lengths and travel times. Available data are limited but suggest that overall travel times to work have increased in recent years. Changes in travel times are the product of a complex mix of trip lengths becoming longer, broadening of peak-travel periods, changes in speeds on commuting facilities, and travel pattern shifts between trips of different typical speeds and lengths. For example, shifts of some trips from transit to private vehicles improve speeds for those trips but may add to congestion, reducing travel speeds for others.

The Auto Commuting Boom

Commuting in the suburbs has favored use of the automobile. Use of private vehicles for work trips not only kept pace with the dramatic growth in commuting, but also exceeded it by increasing its share of total travel as all other modes declined in share of travel.

Auto commuting refers to an array of vehicles including light trucks, vans, and other specialized vehicles used for work-trip travel. With all vehicle types considered, the growth in vehicles owned or otherwise available to households was enormous in the period of study. Between 1960 and 1980 vehicle availability increased from 1.03 vehicles per household to 1.61. Although this rate of growth seems impressive in itself, the substantial growth in households and the decline in persons per household actually mask the full impact of the private vehicle explosion. The number of vehicles available per capita almost doubled in the period. Had household formation rates stayed the same as in 1970, vehicles per household would have averaged about 2 per household. Figure D illustrates trends in factors affecting commuting by personal vehicle.

Changes in distribution of the vehicle fleet among households represents a more significant change than overall growth of the vehicle fleet between 1960 to 1980.

- A majority of U.S. households now have two or more vehicles.
- The number of households without any vehicles shrank by 9% in the period, and the share of households without vehicles dropped from 22% to about 13% of all households.
- Nothing exemplifies the present era in regard to vehicle ownership more than the fact that the number of households with only one vehicle available actually declined in the period.
- Two-vehicle households grew by 172% and three-vehicle households by almost a thousand percent.

The most significant trend regarding vehicle availability in this period was the trend in vehicles available per worker. The number of vehicles available to workers on average rose from 0.85 per worker in 1960 to 1.34 in 1980. This impressive growth does not tell the whole story. Averages can be deceiving. In this case vehicles per household and workers per household are highly symmetric. In every household size category, as measured by workers per household, the majority of households have more vehicles than workers. Another finding is that households without vehicles tend to be households without workers. Two-thirds of households without vehicles also have no workers in the household and another 28% have only one worker. Zero-vehicle households tend to be very small households located in larger central cities.

Figure D. Factors influencing the auto commuting boom

In fact, the New York area alone has 20% of the nation's households having no vehicles.

When these dramatic changes in workers' access to private vehicles are taken into account, it is not surprising that there have been equally dramatic increases in the use of private vehicles for work commuting. In total, the use of private vehicles almost doubled from about 43 million users in 1960 to 83 million in 1980. It is crucial to understanding the character of this change, as well as its scale, that worker growth was only 50% in this period. Therefore, only about half of the growth of private vehicle commuting is attributable to the growth in commuters. The other half is the product of shifts of commuters from other modes of travel to the use of private vehicles. As a result, travel by private vehicle to work rose from about 70% of all travel in 1960 to over 85% in 1980. Other key events in the use of different modes of travel to work were as follows:

- Despite the popular perception of more people working at home, the trend from 1960 to 1980 showed a sharp decline in people working at home. This is in large part attributable to declines in farming. By 1980 working at home only accounted for 2.3% of workers, the majority of whom are now in large metropolitan areas.

- Walking to work similarly declined, although not as strongly. It declined from over 10% of work travel in 1960 to just over 5% in 1980.

• Use of public transit also suffered declines—its share of travel halving, from 12.6% to 6.2% of work travel.

• Each of these travel alternatives declined not only as a percentage of commuting travel but also in absolute numbers. In total, about 5 million fewer workers were using these alternatives in 1980 compared to 1960 (in a period when total workers increased by 32 million). Other surveys indicate that declining use of these alternatives has continued into the eighties.

• Transit use has been severely affected by a number of adverse trends: increased vehicle availability per worker (workers with one or more vehicles available use transit at one-fifth the rate of those who have less than one vehicle available per worker); the shift of jobs to suburban destinations (which average one-sixth the level of transit use as central city destinations); and the overall lack of growth in markets where transit usage tends to be strongest (the intracity market increased by 9% in 20 years—more seriously its most important markets, particularly New York, had substantial losses in downtown travel).

• The average number of persons per private vehicle in work travel showed slight declines in the 1960-1980 period. The national average occupancy for work trips was about 1.15 workers per vehicle. While this figure is relatively uniform across the country, it has a tendency to be higher in non-metropolitan areas and to decline as metropolitan area size increases and mass transit becomes a more viable alternative.

IMPLICATIONS FOR THE FUTURE[1]

Collectively, the worker boom, suburban commuting boom, and auto commuting boom have created an explosion in commuting by private vehicle. In rapidly growing areas, which are areas normally already heavily dependent on private vehicles, use of autos in commuting tends to exceed the very rapid growth in workers, sometimes by substantial margins, as in Houston and San Diego. In slower growing areas, growth in the use of private vehicles exceeds growth in workers by substantial amounts, obtaining users from other modes, as well as from worker growth. The implications of these data are clear—all metropolitan areas, independent of rates of population growth, have undergone substantial growth in workers and even greater growth in the use of private vehicles for commuting.

Implications for Commuting Demand

Each of the identified trends militate in favor of increased levels of commuting travel beyond earlier expectations. It appears that impacts from the baby boom, job boom, and the infusion of women into the work force will persist through the remainder of the century, maintaining high levels of commuting growth.

Beyond the basic impetus to travel demand, these trends will cause changes in commuting patterns that will affect existing transportation plans and the need to plan in the future. Among key factors for consideration are these trends.

• Huge growth in the availability of vehicles to households, and especially to workers, has permanently affected the modal choice decision, assuring use of private vehicles as the mode of choice for the vast majority of work trips.

• Popular expectations of the potential for working at home and alternative travel modes to appreciably reduce commuting by private vehicle have not been realized. Thus, highway demand has increased even beyond the high growth expected from the job boom.

• Suburb-to-suburb commuting flow has become the predominant national communting pattern.

• While suburban flows predominate, growth in traditional suburb-to-city center commuting has been significant and will require continuing interest and concern.

• Growth in the commuting activity is occurring around outer borders of metropolitan areas, in that area between the suburbs and what was considered to be rural area until recently. This has become an important component of metropolitan highway demand, and will need to become a major element in future highway planning.

A crucial characteristic of commuting travel is overall trip length. It is also among the more difficult to evaluate. If the notion that jobs are now following population to the suburbs is a correct assessment of current trends, shorter potential trip lengths may result as jobs get closer to workers. This is suggested by the fact that suburb-to-suburb work trips are 50% shorter than suburb-to-center city work trips. As the proportion of suburban work-trip origins that

[1] While the primary goal of this report is to describe trends in American commuting without drawing programmatic conclusions, the following assessment by the author of some of the implications of the findings is presented to stimulate further thinking and discussion.

- The potential for greater "community balance" between workers and jobs in suburban areas exists, with promise for more efficient commuting patterns, and other far-reaching benefits. This suggests new requirements for interaction and cooperation between metropolitan jurisdictions will arise.

CONCLUSION

The purpose of this report is to give visibility to important new trends, rather than to pose solutions to problems raised by these trends. It is clear that the trends indicate changes in commuting that are substantial in scale and character, with equally extensive implications in the areas of:

- Traffic Operations and Management
- Transport System Planning and Development
- Transit Routing and System Planning
- Government Organization and Programs
- Metropolitan Form, Development, and Governance

What is required is the formation of a new metropolitan strategy focussed on needed public policies and private understanding in these areas based on appreciation of the trends and their implications.

The next step in the development of needed strategies is to more fully identify and analyze the implications of the trends presented here. Among areas of future work should be: detailed case studies of a number of metropolitan areas to gain the detailed understanding of trends not possible at the national scale; analyses of changes in traffic demand patterns looking at facility volumes by direction and time relative to available capacity; and development of better data to support a more comprehensive understanding of perceived trends.

TCI Tri-County Industries

1250 Atlantic Avenue • P O Box 789 • Rocky Mount NC 27802-0789 • (919) 977-3800

Cheston V. Mottershead, Jr.
President

TESTIMONY BEFORE THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

FRIDAY, SEPTEMBER 21, 1990

BY CHESTON V. MOTTERSHEAD, JR.

THANK YOU FOR THE OPPORTUNITY TO SPEAK WITH THIS COMMITTEE ABOUT MY INTEREST AND CONCERNS FOR RURAL TRANSPORTATION.

I AM PRESIDENT OF TRI-COUNTY INDUSTRIES (TCI), A WORK-ORIENTED REHABILITATION CENTER FOR DISABLED PEOPLE IN A FIVE-COUNTY AREA (NASH, EDGECOMBE, WILSON, HALIFAX, NORTHAMPTON COUNTIES). WE PROVIDE COMPREHENSIVE REHABILITATION, TRAINING AND JOB PLACEMENT FOR PEOPLE WITH PHYSICAL, MENTAL, AND EMOTIONAL DISABILITIES. UNTIL 1987, TCI PROVIDED THE TRANSPORTATION SERVICE TO TRANSPORT OUR TRAINEES TO AND FROM OUR CENTER IN ROCKY MOUNT.

I WOULD LIKE TO EXPLAIN OUR SPECIFIC RURAL TRANSPORTATION SITUATION -- WHICH I THINK IS COMMON TO MOST AREAS OF THE U.S. -- SO YOU CAN GET A FEEL FOR THE SUCCESSES AND PROBLEMS OF THE SYSTEM.

NASH AND EDGECOMBE COUNTIES SURROUND THE CITY OF ROCKY MOUNT WHICH HAS A POPULATION OF 50,000. THE TWO-COUNTY POPULATION IS 113,000, WHICH SERVES A 1,000 SQUARE MILE AREA.

THIS PAST YEAR TCI REHABILITATED, TRAINED AND HELPED SECURE EMPLOYMENT FOR A TOTAL OF 565 DISABLED PEOPLE:

+ ALMOST 70% OF TCI'S TRAINEES ARE AT OR BELOW THE POVERTY LEVEL.
+ 50% LIVE WITH ONE PARENT OR GUARDIAN.
+ 25% HAVE BEEN INSTITUTIONALIZED.
+ 40% HAVE MULTIPLE DISABILITIES.

IN 1987, FOUR HUMAN SERVCICE AGENCIES FORMED THE NON-PROFIT NASH-EDGECOMBE TRANSPORTATION SERVICE (NETS) TO BECOME THE LEAD TRANSPORTATION AGENCY; ITS BOARD OF DIRECTORS IS COMPOSED OF TCI, NASH AND EDGECOMBE DSS, AND NASH COMMUNITY COLLEGE. THE ROCKY MOUNT TRANSPORTATION COORDINATOR IS AN AD HOC MEMBER OF THE BOARD. I AM THE BOARD CHAIR.

THE ABOVE AGENCIES ARE REGULAR USERS OF THE 15 VAN SYSTEM. IRREGULAR USERS ARE: A CHILD CARE CENTER, VOCATIONAL REHABILITATION, MENTAL HEALTH CENTER, COMMUNITY ACTION AGENCY AND THE CITY OF ROCKY MOUNT.

LAST YEAR THE NETS SYSTEM OPERATED 252 DAYS, TRAVELED 82,700 PASSENGER TRIPS FOR OVER 515,000 MILES, AT A COST TO THE AGENCIES OF $411,725 OR $.73 PER MILE.

SOME BENEFITS

+ BEFORE THE ADVENT OF RURAL TRANSPORTATION FUNDS; E.G., 16(B)(2), TCI SERVED ABOUT 50 DISABLED PEOPLE IN THE IMMEDIATE ROCKY MOUNT AREA. NOW WE AVERAGE 200 PEOPLE EACH DAY. VANS TRANSPORT OUR TRAINEES FROM AS MUCH AS 50 MILES ONE WAY.
+ DISABLED AND ELDERLY PEOPLE WOULD "SIT ON THE FRONT PORCH" WITH A FAMILY MEMBER AS AN ATTENDANT; TODAY, THAT DISABLED PERSON CAN GET HEALTH SERVICES, GO TO A TRAINING FACILITY -- EVEN GET A JOB -- WHILE THE FAMILY MEMBER CAN ALSO SECURE FULL OR PART-TIME EMPLOYMENT AND NOT WORRY ABOUT THEIR DISABLED SON OR DAUGHTER
+ RATHER THAN BUILDING SMALL FACILITIES WITHIN MANY SMALL TOWNS, OUR TRANSPORTATION SYSTEM ALLOWS COMPREHENSIVE CENTERS TO DEVELOP WITH LOWER BUILDING, EQUIPMENT AND ADMINISTRATIVE COSTS AND HIGHER QUALITY OF SERVICES.

SOME PROBLEMS

+ THE COST OF TRANSPORTATION IS BECOMING A DOMINANT BUDGET EXPENSE FOR THE OPERATIONS OF MANY RURAL HUMAN SERVICE AGENCIES..
+ HUMAN SERVICE AGENCY BUDGETS ARE BEING REDUCED OR AT LEAST REMAIN STAGNANT AS TRANSPORTATION COSTS RISE. THIS MEANS THAT LESS SERVICES CAN BE PROVIDED TO RURAL, DISABLED AND ELDERLY PEOPLE; THIS IS ANOTHER EXAMPLE OF THE POOR BECOMING POORER IN OUR SOCIETY.

SOME SOLUTIONS

+ THE PASSAGE OF ADA IS SEEN AS A SHORT-TERM PROBLEM, BUT A LONG-TERM SOLUTION. THERE WILL BE ADDED EXPENSES TO SOME TRANSPORTATION SYSTEMS, BUT THE ADA WILL STIMULATE MORE DISABLED PEOPLE TO ENTER TRAINING AND EDUCATION PROGRAMS AND SEEK EMPLOYMENT. SINCE THE LABOR MARKET WILL HAVE LESS AND LESS TRADITIONAL APPLICANTS, MORE AND MORE DISABLED PEOPLE WILL HAVE AN OPPORTUNITY TO BECOME FINANCIALLY INDEPENDENT. ADEQUATE TRANSPORTATION CAN PROVIDE THE REALITY OF THIS. ADEQUATE TRANSPORTATION WILL HELP MAKE EMPLOYMENT A REALITY.
+ SYSTEMS LIKE NETS NEED TO BE MORE EFFICIENT.
  - GREATER LOCAL PREVENTATIVE MAINTENANCE.
  - BETTER DRIVER TRAINING AND SUPERVISION.
  - COORDINATE BETWEEN RURAL AND URBAN SYSTEMS (TDP).
  - ENCOURAGE MULTI-COUNTY SYSTEMS IN SPARSELY POPULATED AREAS -- THUS REDUCING ADMINISTRATION AND VANS/EQUIPMENT EXPENSE.
  - CREATE "BUS STOPS" FOR PASSENGERSTO REDUCE DOOR-TO-DOOR SERVICE.

+ INCREASE FEDERAL SHARE OF SECTION 18, SO LOCAL GOVERNMENTS CAN UTILIZE THEM BY PROVIDING A REASONABLE LOCAL SHARE.
+ INCREASE FEDERAL FUNDS FOR 16(B)(2) TO MEET THE RISING COSTS OF VEHICLES AND EQUIPMENT.

9/90

I TRY VERY HARD AND MY STAFF OF 70 PEOPLE TRY VERY HARD TO MANAGE THE MEAGER FUNDS WE RECEIVE FROM STATE AND FEDERAL SOURCES -- SO OUR REHABILITATION PROGRAMS CAN HELP DISABLED PEOPLE BECOME AS INDEPENDENT AS POSSIBLE.

I EVEN SPENT SOME TIME WITH THE GENERAL ASSEMBLY AND SENATOR ROYAL TRYING TO HELP THEM FIND ADDITIONAL FUNDS FOR THE MENTAL HEALTH PROGRAMS THAT HE ADVOCATES FOR SO ELOQUENTLY.

PLATOON COMMANDER

AS AN OFFICER IN THE MARINE CORPS, MY JOB WAS TO HELP OUR YOUNG MARINES DO THEIR JOB, TO ADVOCATE FOR THEM, TO GIVE THEM A SENSE OF PURPOSE AND FULFILLMENT IN THEIR LIVES.

I LOOK AT BOTH THESE EXPERIENCES, AS A MARINE CORPS OFFICER AND A MANAGER OF A REHABILITATION FACILITY, THEN I REFLECT ON THE SITUATION IN THE MIDDLE EAST AND MY BEING BEFORE THIS COMMITTEE; I AM STRUCK BY THE INCONGRUITY.

EACH DAY OUR FEDERAL GOVERNMENT SPENDS $41,000,000 TO PROTECT SOME OIL FIELDS IN "OPERATION DESERT SHIELD."

THE TRANSPORTATION COSTS FOR NETS THIS PAST YEAR WAS $400,000.

THE REASON WE ARE SPENDING THIS MONEY PROTECTING OIL FIELDS IS BECAUSE WE HAVE NO ENERGY POLICY. WE HAVE FORGOTTEN AND FRITTERED AWAY POSSIBLE SOLUTIONS TO OUR EXTRAORDINARY ENERGY NEEDS THAT WE STARTED IN THE EARLY 1970'S.

RURAL + URBAN TTC

JUST IMAGINE WHAT A STRONG ENERGY POLICY -- IMPLEMENTED OVER 20 YEARS AND ENHANCED EVERY YEAR-- WOULD HAVE DONE FOR OUR TRANSPORTATION COSTS TODAY. THAT, IS THE BIG SOLUTION TO OUR TRANSPORTATION NEEDS; AND WE NEED TO BEGIN GRAPPLING WITH THAT TODAY.

THANK YOU FOR THIS OPPORTUNITY TO BRIEFLY EXPLAIN HOW FEDERAL DOLLARS ARE AFFECTING A RURAL AREA IN EASTERN NORTH CAROLINA.

RESPECTFULLY YOURS,

CHESTON V. MOTTERSHEAD, JR.

CVMJR:TC

TESTIMONY

before
the
SURFACE TRANSPORTATION SUBCOMMITTEE
of the
HOUSE PUBLIC WORKS COMMITTEE

on
REAUTHORIZATION
of the
SURFACE TRANSPORTATION ACT

September 21, 1990
Field Hearing

presented by

Sue Myrick, Mayor
City of Charlotte

GTL - 9/18/90

At the beginning: remarks expressing appreciation for opportunity to speak to sub-committee.....

1. Funding for Public Transportation

Charlotte has made a significant local commitment to funding for its public transportation system. Through local sales tax and auto registration fees dedicated to public transportation, in FY90 it will contribute over 55 percent of the budget, and 85 percent of the operating deficit for the system. In 1981 the federal government contributed 50 percent of the deficit. Charlotte's bus fleet and facilities have benefitted from federal capital assistance, yet we now find ourselves with almost 20 percent of our fleet over 15 years old, and without sufficient federal capital assistance to program timely bus replacements for our expanding system.

There are three key aspects to federal transit assistance:

- the amount of funds available
- flexibility in their use
- the matching ratio for fund categories

The City is demonstrating its willingness and ability to provide public transportation funding. While a greater amount of assistance would be welcomed, and high ratios of federal to local matching funds permit us to make our own dollars go further, we recognize the budget constraints under which all federal programs are operating.

Greater flexibility in local decisions regarding use of federal funds, and in programming them over several years, would offset, to some extent, steady funding levels and matching ratios. Now we have inadequate funds and categorical restrictions on their use.

We urge you to

- Allow local governments greater flexibility and discretion in the use of federal funds through removal of category restrictions and establishment of block public transportation grants.

2. Equity and Predictability of Public Transportation Funding Distribution

Charlotte is a rapidly growing, highly congested City which is just now reaching the size and density threshold for which higher capacity transit, such as

light rail, is appropriate. Yet public transportation is a key element in meeting our transportation needs.

North Carolina has received an average of less than $2 million per year from the Mass Transit Account while contributing nearly $40 million per year. We need more equitable access to these funds to meet our needs for bus transit and other transit alternatives.

We urge you to establish a formula basis for the Mass Transit Account allocation, or a minimum return to each state, as a means of providing equity and acknowledging that there is a broad spectrum of transit solutions to our transportation problems. We believe that a disproportionate share of Mass Transportation Account funds now is going to rail-related solutions. A formula-based allocation, or minimum return, also would increase the predictability of fund availability.

3. Regulation

Protection for the rights of transit employees was an important issue when ownership of large numbers of public transportation systems was moving from the private to the public sector in the 1960's and early 1970's. The legislation, and subsequent regulations,

guaranteeing those rights now has become partially outmoded.

We urge you to re-examine the provisions and, particularly, the implementation of Section 13(c) of the Surface Transportation Act to bring them into line with current conditions in the industry.

4. Funding for Streets and Highways

In common with many other urban areas across the country, Charlotte is suffering not only from growth but also from increased per capita automobile ownership and use. Current federal - and State - programs simply cannot provide sufficient funds to enable us to keep up with demand. Our long-range planning projects highway construction of $2 billion over the next 15 years, but state and federal funds are anticipated for only about one-half of that amount. We have authorized locally funded construction of almost $150 million in the past three years, but have nearly exhausted our bonding capacity and pay-as-you-go resources.

Congestion and safety on Charlotte's existing roadways are significant problems. The number of high congestion and high accident locations in Charlotte

has increased significantly over the past 8 to 10 years.

We urge you to give increased emphasis to urban and suburban highway funding in the new Surface Transportation Act. This might be accomplished if the flexible highway program, proposed by AASHTO, returns a fair share of funds to each state, permitting the flexibility to put funds to work on urban and other high priority needs. Other mechanisms which might be considered include:

- increased funding for the Federal Aid Urban System
- block grants to local urban areas
- delineation of more extensive systems of federal aid highways in urban areas (additional Interstate; incorporation of major primary highways, or both).

This increased flexibility also should allow opportunity to address programs such as

- transportation system management efforts to increase the capacity of surface arterial highways

and improve operating conditions for public transportation

- safety projects, to treat high accident locations within the area, both on the federal aid system and on locally built and maintained roadways.

5. Related Matters

Although not directly part of the re-authorization of the Surface Transportation Act, other federal policies significantly impact public transportation activities in the local area.

It is incomprehensible, in a world which is choking on automobile exhausts, that free or underpriced parking is an untaxed employee benefit while employer subsidies to employee of over $15/month for transit passes are treated as taxable income. This sends precisely the wrong signal to commuters making their choices on how to get to work. It remains a source of great frustration to public transportation professionals across the country that this problem remains unresolved.

Charlotte is looking to the future in attempting to purchase and protect rail corridors, which are being

abandoned, for future transit use. Local governments need a better opportunity, and more leverage, to participate in the processes of abandonment about which we frequently learn too late and in which we are placed in a difficult bargaining position.

At the end: expression of appreciation for the opportunity to testify, acknowledgement of the difficulty of the task which the sub-committee has before them.....

U. S. HOUSE OF REPRESENTATIVES
SURFACE TRANSPORTATION SUBCOMMITTEE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SEPTEMBER 21, 1990

STATEMENT OF

ELBERT L. PETERS
PRESIDENT

NORTH CAROLINA TRUCKING ASSOCIATION, INC.
219 WEST MARTIN STREET
RALEIGH, N. C. 27602

(919) 834-0387

INTRODUCTION

Thank you for the opportunity to testify concerning the future of the Federal-aid highway program and related surface transportation issues. I am pleased to share with you the views of the North Carolina Trucking Association, an organization with more than 500 members which was organized in 1929.

Trucking is essential to the economic well-being of North Carolina. A glance at some fundamental facts about the motor carrier industry in North Carolina will confirm trucking's critical role in ensuring the continuation of the state's economic vitality. Based on 1988 data, the industry:

- Employs 214,395 persons.
- Had a payroll in 1988 totaling over $3.9 billion.
- Serves all of North Carolina populated communities of which 69.5% depend entirely on trucks.
- Paid $610 million in 1988 State and Federal Highway Taxes, accounting for 48.1% of the total state and Federal Highway Tax receipts paid by all motor vehicles, approximately $11.7 million each week.
- Trucks paid $381.8 million in State Highway User Taxes 43.8% of the total paid by all motor vehicles.
- State and Federal Highway User Taxes paid on one large truck combination are 30 times greater than those paid by one medium passenger car.

Nationally too trucks have become the carrier of choice of America's shippers. Over 77% of the value of everything America grows and produces now moves on trucks. Freight revenue now exceeds $240 billion annually, and the trucking industry generates fully 5% of this Nation's gross national product. The trucking industry employs 7.5 million Americans, and pays them $160 billion in wages annually. Trucks pay over $50 million a day in highway use taxes which represents more than 45% of all state and federal taxes paid.

I would like to provide further information on six critical areas for your consideration:

- o Program Structure
- o Program Finance
- o Safety
- o Highway Design
- o Productivity
- o Related Issues

Program Structure:

We believe that the preservation, expansion, and reconstruction of the National System of Interstate and Defense Highways and major primary highways of national concern should be the cornerstone of a new Federal highway program . Other arterial routes necessary to develop a national network should be included in the system.

More specifically, the new national system should consist of 140,000 to 180,000 miles which will effectively connect all of the nation's population centers and accommodate approximately 45% of all traffic movements, including 70% of all commercial traffic.

Primary or arterial routes which are incorporated into the Highways of National Significance should be upgraded to standards adequate for the traffic volumes and vehicle populations using such routes on a priority basis. Some may need to be upgraded to near Interstate System standards, but many may simply need to be rehabilitated to modern geometric standards and to provide for adequate traffic movement.

Full Federal-aid funding, as now authorized, should be provided through FY 1991. After completion of the Interstate System, the Highways of National Significance must become the principal Federal aid system. This system should be funded at a level to meet essential future needs. Fund distribution to the new system should be by an equitable formula.

Federal aid should continue for major bridges and for secondary and urban roads off the National system to improve urban, suburban and rural mobility. Many interstate freight movements begin or end on lesser rural and urban primary and secondary routes and federal aid programs should support major construction projects on these routes.

Accordingly, a significant federal aid program for routes not included on the new National system will remain a high priority for the trucking industry. Increased federal highway spending should be sought for these categories through 1995 either by reducing specific categories or by block grant programs with some restrictions on use.

Program Finance:

The money is in the Federal Highway Trust Fund now to start this program with funding at an annual funding level of $17.5 billion. No new taxes are needed and none should be considered until the current fund balances in the Highway Trust are adequately committed. Shifting the burden to state and local funding denies the national nature of the highway program. Continued federal funding for major secondary and urban road projects and for bridges is also needed and can be supported by this level of funding.

Expansion of the use of Highway Trust Fund dollars for purposes other than highways is not a viable option and should not be considered. Shifting a greater burden of highway construction cost to state and local governments could mean a back-door tax increase and lead to the deterioration of the concept.

There is evidence of continued excise tax evasion. While the Internal Revenue Service has voiced concerns they have done little to stop it. North Carolina has realized considerable gains from using State Highway Trust Fund monies to establish a special tax unit charged with enforcing highway tax laws. We believe that the use of Federal Highway Trust Fund monies to enhance State and Federal highway tax enforcement efforts will also pay large dividends. We support the emphasis contained in the National Transportation Strategy to curtail excise tax evasion. Proper audit and enforcement could add $1 billion to the Highway Trust Fund. And the elimination of 'gasohol' exemptions could also add nearly $500 million to the Trust Fund every year.

Safety:

According to the Fatal Accident Reporting System (FARS) of the U. S. Department of Transportation (the most reliably collected truck accident data on a national scale) the data from 1976 to 1986 indicates that fatal accident rates per million truck miles have steadily fallen through the 1980's. (See chart below)

Fatal Accident Statistics for Combination Vehicles

1976-86

	Number of Fatal Accidents	Vehicle Miles Traveled (billions)	Fatal Accident Rate (per 100 million miles)
1976	3260	49.7	6.56
1977	3613	55.7	6.49
1978	4066	63.0	6.45
1979	4307	67.0	6.43
1980	3731	68.7	5.43
1981	3863	69.1	5.59
1982	3519	66.7	5.28
1983	3645	69.8	5.23
1984	3907	77.4	5.05
1985	3892	79.6	4.89
1986	3825	82.7	4.63

Note: Combination vehicles include all separate tractor-trailer combinations.

The Motor Carrier Assistance Program has been an extremely successful federal - state partnership to reduce commercial motor vehicle accidents. The program has received increased funding levels every year to its present level in FY 90 of $60 million. We believe the program should continue and that funding should be increased. We believe that increased funding should be directed towards providing more effective training for inspectors charged with the responsibility of randomly inspecting commercial motor vehicles.

Since 1974, almost $5 billion has been obligated from the Highway Trust Fund for rail-highway crossing improvements under the section 130 rail-highway crossing program, other Federal-aid programs, and the section 163 railroad relocation demonstration program. Almost 40% of these funds have come from Federal Highway user fees paid by the trucking industry into the Highway Trust Fund.

Because these programs provide substantial benefits to the railroad industry, the law requires the railroads to contribute private funds to individual projects. Under section 130(b) of title 23, the railroads are required to contribute up to 10% of total project costs which the Secretary determines will represent the net benefit to the railroads of each project type.

Unfortunately, the regulations under which the railroads have operated since 1975 have served to limit their required contributions to a minuscule level, perhaps 1% of Federal-aid project costs. These sweetheart regulations should be reevaluated to assure that the railroads pay their fair share of rail-highway crossing project costs.

Highway Design:

A recent study by Kenneth A. Small, Clifford Winston and Carol A. Evans, Road Work, published by the Brookings Institution, observes that the trucking industry and the Nation are paying a steep price for suboptimally designed pavements and that "trucks would damage roads far less if roads were correctly built in the first place." In reaching this conclusion, the study assumes life cycle highway costs would be minimized through optimal highway design -- in their words, by adding "pavement thickness (or other measures to improve durability) until the incremental cost of additional durability equaled the incremental savings in maintenance and (highway) user costs." With these durability improvements, the study suggests that the costs attributable to heavy combination vehicles would be 1/3 less than their current road user charges.

The economies of scale of building stronger and thicker pavement structures are enormous. According to American Association of State Highway and Transportation Officials (AASHTO) design procedures, one additional inch of pavement effectively doubles the strength (and life) of the pavement yet adds only 4% to pavement related construction costs and less than 1/2 of 1% to the total construction costs of a rural Interstate highway (according to Federal Highway Administration (FHWA) cost data.) Virtually without exception, the incremental savings in future highway maintenance, rehabilitation and highway user costs will far outweigh the incremental costs of thicker pavements.

A typical concrete pavement section on rural Interstate highways today is 10" thick. According to current AASHTO design procedures, this design will accommodate a minimum of 5 million 18,000 pound axle load applications (or its equivalent.) Eight times more durable than a 10" concrete pavement, a 14" concrete pavement adds but 15% to pavement related construction costs and less than 2% to the total construction cost of a new highway. Pavements on main line truck routes should be built at least 14" thick.

The economies of scale of thicker pavements have long been acknowledged by the highway engineering profession. In testimony before Congress, FHWA has stated that pavement strength goes up with the seventh power of pavement thickness.

We strongly recommend that the Nation begin building and rebuilding its major highways with stronger and thicker pavement structures and better draining base courses. This strategy will increase the probability that pavements will last their intended lives, dramatically reduce life cycle pavement and highway user costs, and make the transportation sector a more productive part of the economy.

Productivity:

Highway freight transport is the largest freight transportation element in the gross national product -- by a large margin. But its importance far transcends direct dollar input to GNP because it is so interwoven in the fabric of virtually every other economic activity in our complex modern economy. For that reason, improved truck productivity could greatly benefit our domestic economy and will be vital to our competitive position in the international markets of the next decade.

Productivity could be greatly enhanced by the nationwide relaxation of regulations which now needlessly restrict reasonable access to and from the national network for STAA vehicles. The future federal highway program should include provisions to address this problem.

Related Issues and Conclusion:

Beginning in fiscal year 1992, $50 million should be earmarked each year for trucking-related research and development expenditures within the Department of Transportation. These funds should be employed for research, development, and demonstration programs aimed specifically at enhancing trucking safety, productivity and international competitiveness. This research should include efforts to improve off-ramp construction and signing, downgrade signing and truck rest area solutions.

Finally, we urge this Committee to make its decision based on sound economics, engineering, demographics and business and international trade issues. We must not lose sight of these issues and make decisions based on politics. The course we set in this new highway reauthorization legislation will set the stage for our children and our society for years to come.

Unfortunately, the regulations under which the railroads have operated since 1975 have served to limit their required contributions to a minuscule level, perhaps 1% of Federal-aid project costs. These sweetheart regulations should be reevaluated to assure that the railroads pay their fair share of rail-highway crossing project costs.

TO
Subcommittee On Public Works And Transportation
House Of Representatives
Congress Of The United States
September 21, 1990 - 10:00 AM
Microelectronic Center Of North Carolina - Durham
BY

Clint M. Reese
Member OF The Executive Committee
NORTH CAROLINA HIGHWAY USERS CONFERENCE
P.O. Box 167
Raleigh, North Carolina 27602
Phone: 919/828-5438

38-253 O—91——106

Our organization is composed of some 49 state associations and companies operating in the private sector with a wide range of interest in matters which affect or influence the cost and quality of highway transportation. A current list of our membership is attached to copies of this testimony.

Our testimony will deal with an issue which is a matter of tremendous, long standing concern to all of our members. This is the question of highway financing. One of the reasons the federal highway program has been so successful is due to its financing mechanism. The same is true for most State programs as well, especially here in North Carolina.

As we all know, the federal Highway Trust Fund is the source of finance for the federal government's contribution to the national highway systems. The revenue for this Fund comes from certain special and selective taxes which are levied on taxpayers solely because of their use and ownership of motor vehicles that operate on the public highways. Their payment of these taxes are in addition to all the other taxes any citizen would pay.

Because these are special and selective taxes, we strongly believe they should be used only for improvement to the State and federal highway programs. They are not the proper revenue source for general tax needs. The reasons are:

* MOTOR FUEL TAXES ARE HIGH - the combined state and federal motor fuel taxes are now equivalent to a sales tax in excess of 30%. Taxpayers have generally supported this enormous tax load because highway taxes have traditionally been used to improve highway and traffic conditions. This has resulted in direct savings in time, safety and convenience to those being taxed. To use these taxes otherwise would result in very unfair taxation.

* MOTOR FUEL TAXES ARE REGRESSIVE - these taxes are levied evenly on the rich and poor alike without any regard for the "ability to pay", a common yardstick of tax fairness. They fall most heavily on lower and middle income groups. Expenditures for gasoline by household with annual income below $7,400 average about 8% annually while those with incomes of $36,000 would use only about 4%. Moreover, the federal government estimates that about 78% of persons making under $10,000 per year commute to work by motor vehicle.

* HIGHWAY TRANSPORTATION IS NOT A LUXURY - most household driving is not discretionary. 35% of household auto travel is either to work or is work related; 34% is for family business, shopping, medical, school and church trips; 27% is for social purposes or visiting friends and relatives. Only 4% is for vacation and pleasure. The degree of vehicle use depends largely on where on lives. In non-urban areas of 5,000, each household generates just over 56 miles of auto travel per day. In all metropolitan areas with over 1.25 million population per household travel is about 40 miles per day. 87.5% of all workers travel to work by private motor vehicle. These are national figures. In North Carolina, the use of motor

vehicle transportation is probably much higher for all transportation needs because of the geography of the State.

* SUCH TAXES WOULD BE INFLATIONARY - motor fuel tax revenues traditionally have been used to improve highway facilities, thereby reducing transportation costs to consumers and business. However, if used for non-highway purposes, they become an inflationary tax burden. Loading more taxes on essential consumer items would drive up the cost of all goods and services. They would be particularly hard on agriculture, recreational travel and manufacturing. There is virtually no consumer product or service which is not handled several times by motor vehicle during its development and marketing. For instance, a loaf of bread will have had highway taxes loaded on its final cost at almost every stage of production, beginning at the nursery as seed grain, to its final destination in the retail store as bread.

* DIVERSION DAMAGES HIGHWAY PROGRAMS - good highway are essential to a healthy economy and many economic experts believe we are already seriously underfunding our highway systems. Therefore, the use of highway taxes for non-highway purposes robs the American economy of one its most most important economic needs, an efficient and affordable highway transportation network.

* DIVERSION COULD AFFECT AMERICA'S COMPETITIVENESS - adding additional taxes or using current ones for non-highway purposes would add to the cost of virtually all manufactured goods. The "on time" delivery system used by many manufacturers is highly dependent on efficient highway transportation. Without the costs savings association with this system, the ability of many American businesses to compete with foreign firms in both the domestic market and abroad would be seriously impaired.

The federal highway program is a rarity in the entire federal inventory of programs. It cost the federal government nothing. Only the people who use highway transportation are taxed to support the program. By law it cannot create any debt and therefore adds nothing to the federal deficit problems; and, it provides an enormous public resource through which the entire Nation benefits.

It is obvious that the federal government has an important role to play in helping assure that our national highway transportation needs are met and we urge that a sound and equitable federal highway program be re-enacted in 1991.

We further recommend that the post-1991 federal highway program be restructured to reflect the sound fiscal system and tax fairness structure upon which the 1956 Act was originally based. In order to accomplish this, we recommend the following changes:

1) because of the sound financial foundation upon which this program is built and the independent funding of this program, it should be removed from the Unified Budget process. This would help prevent the use of the Highway Trust Fund revenues to help balance the federal budget.

2) the current provision which takes 1 cent of the federal motor fuel tax for mass transit should be eliminated. We have no quarrel with other modes of transportation; however we object strongly to the use of regressive and selective highway user tax levies to finance these systems.

3) the current balance in the Highway Trust Fund, estimated to be around $17 billion, should be drawn down to levels which are within the boundries of accepted accounting principles.

4) we strongly object to any suggestion that highway users, as special class of taxpayer, should be singled out to carry a disproportionate share of the federal deficit through such means as using motor fuel taxes for deficit reduction.

The Governor and the General Assembly of North Carolina recently recognized the importance of highway transportation by passing one of the most comprehensive highway programs in the State's history. They recognized that the State's economy and its quality of life are directly related to the quality of our highway system. The better the roads, the more quickly and economically we can move the goods and services on which our citizens and businesses depend, and which affect our competitiveness in the world marketplace. To keep this vision from fading, we are looking to the United States Congress to put forth a federal highway program for the 21st Century which will assure us a continuation of an affordable, efficient highway transportation program which will meet our State's growing needs.

TESTIMONY BEFORE

HOUSE COMMITTEE ON PUBLIC WORKS
AND TRANSPORTATION

DURHAM, NORTH CAROLINA
SEPTEMBER 21, 1990

BY: HAL RIVES, COMMISSIONER, GEORGIA
DEPARTMENT OF TRANSPORTATION

MR. CHAIRMAN, MEMBERS OF THE COMMITTEE, IT IS AN HONOR AND A PLEASURE FOR ME TO APPEAR BEFORE YOU AND TALK ABOUT TRANSPORTATION ISSUES FACING GEORGIA AND OUR NATION. I AM PLEASED TO BE HERE AND BE A PART OF THIS TIMELY DISCUSSION.

I BELIEVE NATIONAL TRANSPORTATION POLICY IS CRITICALLY IMPORTANT TO US BOTH AS A NATION AND AS INDIVIDUAL STATES. I AM NOT SURE HOW MANY AMERICANS ARE AWARE OF THIS. BUT, ALL OF US REALIZE WE ARE LIVING IN AN AGE OF UNPRECEDENTED CHANGE. AND THERE'S NO END IN SIGHT.

WE HAVE WITNESSED, AND ARE WITNESSING, EVENTS OF HISTORIC PROPORTIONS:

- DISMANTLING OF THE BERLIN WALL AND THE REUNIFICATION OF A DIVIDED GERMANY;

* FREEING OF EASTERN EUROPE FROM DECADES OF REPRESSIVE COMMUNIST ROLE;
* THE FUNDAMENTAL RESTRUCTURING OF THE SOVIET EMPIRE; AND
* THE PROSPECTS OF A SINGLE EUROPEAN ECONOMIC COMMUNITY IN 1992 - AND A NEW ECONOMIC ORDER.

WE SEE AHEAD MANY CHALLENGES AND OPPORTUNITIES. THE FORCES OF THE FUTURE WILL BE ECONOMIC POWER, POLITICAL UNITY, AND THE STRENGTH OF OUR CULTURAL INSTITUTIONS. WE MUST REASSESS OUR SENSE OF NATIONAL PURPOSE IN AN ENVIRONMENT WHERE MILITARY POWER WILL PLAY A LESSER ROLE.

SECRETARY SKINNER REMINDED US IN HIS PREFACING LETTER TO THE U.S. DOT'S POLICY DOCUMENT, "MOVING AMERICA", THAT WE ARE APPROACHING A NEW ERA IN TRANSPORTATION, BUT WE ARE NOT YET PREPARED FOR THE CHALLENGE.

IN GEORGIA, WE HAVE BEEN VERY FORTUNATE. WE HAVE RECENTLY COMPLETED AN EXTENSIVE RECONSTRUCTION OF ONE OF OUR MAJOR URBAN FREEWAY SYSTEMS, ONE OF THE LARGEST SUCH RECONSTRUCTIONS IN THE COUNTRY. TO ME THIS REPRESENTS AN EXCELLENT EXAMPLE OF OUR SUCCESS IN ACHIEVING STATE PRIORITIES, AND IT DEMONSTRATES THE CRITICAL IMPORTANCE OF THE FEDERAL PROGRAM IN ADDRESSING ISSUES THAT ARE NATIONAL IN SCOPE.

CONTRARY TO THE PREVAILING BELIEFS ABOUT THE 1990'S BEING A DECADE OF ECONOMIC SLUGGISHNESS FOR AMERICA, WE SEE THE 1990'S AS A TIME TO RESTORE OUR INFRASTRUCTURE FOR THE CHALLENGES OF THE NEXT CENTURY.

AMERICA NEEDS TO FOCUS ON PROVIDING GREATER MOBILITY. WE NEED TO AGGRESSIVELY ATTACK URBAN CONGESTION. WE NEED TO BRING OUR RURAL AREAS OUT OF DECADES OF ECONOMIC ISOLATION. WE NEED TO REPLACE MODAL RIGIDITY WITH FLEXIBILITY AND GREATER CONSUMER CHOICE; WE NEED TO WORK HARDER TO REDUCE ACCIDENTS AND FATALITIES. AND WE NEED TO MAKE RESEARCH AND TECHNOLOGICAL INNOVATION A REAL PART OF OUR NATIONAL TRANSPORTATION PROGRAM AGAIN.

THIS WILL MEAN REDEDICATING OURSELVES AND COMMITTING THE RESOURCES NECESSARY. BUT WE ARE UNDERTAKING A CRITICAL INVESTMENT IN OUR FUTURE.

LET ME SHARE WITH YOU WHAT WE ARE DOING IN GEORGIA, AND WHAT WE SEE AS CRITICAL TO OUR FUTURE.

WE HAVE ALMOST 107,000 MILES OF PUBLIC ROADS IN GEORGIA. ROUGHLY 17 PERCENT, OR NEARLY 18,000 MILES ARE THE DIRECT RESPONSIBILITY OF GEORGIA DOT. LIKE MANY OTHER STATES, WE SET A GOAL TO RESURFACE OR REHABILITATE 10 PERCENT OF OUR STATE SYSTEM EACH YEAR. WE STRONGLY BELIEVE IN TIMELY MAINTENANCE. CONSEQUENTLY OUR HIGHWAYS ARE AMONG THE BEST MAINTAINED IN THE NATION.

BUT AS WE CONTINUE TO INCREASE THE NUMBER OF LANE MILES ON OUR SYSTEM - IN RESPONSE TO GROWTH DEMANDS - WE ARE BEGINNING TO HAVE DIFFICULTY IN MEETING OUR OWN HIGH MAINTENANCE STANDARDS. IN FACT, WE WERE ABOUT 22 PERCENT BELOW OUR MILEAGE GOAL FOR RESURFACING IN 1990.

WE HAVE APPROXIMATELY 15,000 BRIDGES IN GEORGIA. THIRTY-ONE PERCENT ARE CURRENTLY STRUCTURALLY DEFICIENT OR FUNCTIONALLY OBSOLETE AND REQUIRE REPLACEMENT OR RECONSTRUCTION. NEARLY 60 PERCENT OF THE NEED IS FOR LOCAL (OFF-SYSTEM), BRIDGES. THIS WILL PLACE A HEAVY BURDEN ON FINANCIALLY PRESSED LOCAL GOVERNMENTS. CURRENTLY, WE HAVE A $269 MILLION BACKLOG OF STRUCTURALLY DEFICIENT BRIDGES STATEWIDE. WE SHOULD BE SPENDING $20 MILLION MORE ANNUALLY THAN OUR CURRENT LEVEL.

IN 1977, WE INITIATED A PROGRAM TO ASSIST LOCAL GOVERNMENTS IN MAINTAINING THE 50,000 MILES OF PAVED STREETS AND ROADS UNDER THEIR JURISDICTION.

OUR CURRENT ANNUAL PROGRAM FOR LOCAL MAINTENANCE ASSISTANCE RUNS AROUND $40 MILLION. TO MEET THE MINIMUM NEED WE SHOULD BE SPENDING 55 PERCENT MORE THAN THIS. PRESENTLY, WE CAN ONLY ADDRESS ABOUT 60 PERCENT OF THE FULL NEEDS REQUESTED BY LOCAL GOVERNMENTS.

SINCE 1984 THE STATE HAS SPENT OR COMMITTED MORE THAT $600 MILLION OVER AND ABOVE OUR MOTOR FUEL TAX COLLECTIONS TO A PROGRAM TO BUILD A STATEWIDE SYSTEM OF 4-LANE HIGHWAYS TO STIMULATE ECONOMIC DEVELOPMENT AND EXPAND ACCESS FOR OVERSIZE TRUCKS. THIS IS AN AMOUNT ROUGHLY EQUIVALENT TO OUR ANNUAL CAPITAL BUDGET. BEGINNING IN FISCAL YEAR 1992 AND WITH PRESENT COMMITMENTS, WE WILL BE ABOUT $360 MILLION BEHIND IN THIS PROGRAM.

I HAVE SPOKEN BEFORE ABOUT THE RAPID GROWTH WE ARE EXPERIENCING IN COUNTIES WITHIN THE SUBURBAN AREAS NEAR OUR LARGE CITIES. I REFERRED TO THE TRANSPORTATION PROBLEMS IN AREAS THAT HAVE MADE RAPID TRANSITIONS FROM RURAL TO METROPOLITAN STATUS.

BECAUSE OF GEORGIA'S HIGH GROWTH, WE HAVE HAD A NUMBER OF SUCH ADJACENT COUNTIES ADDED TO OUR METROPOLITAN AREAS IN THE 1970'S AND 1980'S.

NOT INFREQUENTLY, PREVIOUS 1960 POPULATIONS IN THESE COUNTIES HAD BEEN FIFTY TO SIXTY PERCENT RURAL. AND 50 PERCENT OR MORE OF THE TOTAL LAND AREAS HAD BEEN FARMS.

MANY OF THESE COUNTIES WERE INFLUENCED BY THE ECONOMIC GROWTH STRENGTH OF A FAST GROWING URBAN CENTER.

YET GROWTH WITHIN A REGION WOULD OFTEN BE DECENTRALIZED, REFLECTING A DESIRE FOR SMALL TOWN LIVING AND THE INFLUENCE OF INTERSTATE HIGHWAYS, BUILT IN THE 1960'S AND 1970'S. MOST SUBURBAN COUNTIES THEREFORE, BECAME HIGHWAY/AUTOMOBILE COMMUNITIES, WITH TYPICALLY HIGH OUT-COMMUTING PATTERNS.

GEORGIA HAS ONE OF THE HIGHEST COMMUTING RATES IN THE COUNTRY. ONE IN FOUR GEORGIA WORKERS COMMUTE ACROSS COUNTY LINES TO WORK. IN SOME METROPOLITAN COUNTIES, AS MANY AS 60 PERCENT OR MORE OF WORKERS COMMUTE OUTSIDE THEIR COUNTY OF RESIDENCE TO WORK.

WHERE INTERSTATE HIGHWAYS PASS THROUGH SUBURBAN COUNTIES, MOST BUSINESS DEVELOPMENT HAS TENDED TO OCCUR ALONG FRONTAGE ROADS AND INTERCHANGES. RESIDENTIAL DEVELOPMENT HAS BECOME DISPERSED, WITH SIGNIFICANT PORTIONS OF THE POPULATION STILL CLASSIFIED AS RURAL, REFLECTING THE EXTENT OF SUBURBAN DISPERSION.

CHARACTERISTIC OF THE PROBLEMS FACING NEWER SUBURBAN COUNTIES ARE:

* OLD INTERSECTION LAYOUTS THAT ARE INEFFICIENT,
* TOO MUCH PRESSURE ON TOO FEW INTERSTATE ACCESS ROUTES,
* INSUFFICIENT CAPACITY ON ARTERIAL ROUTES SERVING RESIDENTIAL DEVELOPMENT AND PROVIDING FREEWAY ACCESS,
* INTERCHANGE AND FRONTAGE ROAD SPACING PROBLEMS THAT CONTRIBUTE TO CONGESTION, AND
* AT GRADE RAIL CROSSINGS ON MAJOR ARTERIAL ACCESS ROUTES SERVING THE OLDER COMMUNITIES.

PRESSING NEEDS IN SUBURBAN COUNTIES ARE FOR:

* REALIGNING OLDER INTERSECTIONS, TO IMPROVE CAPACITY AND OPERATING EFFICIENCIES,
* ADDING NEW INTERCHANGES TO PROVIDE ACCESS TO LOCAL COMMUNITIES AND SEPARATING CITY-BOUND FROM INTERSTATE-BOUND TRAFFIC,
* CONSTRUCTING ADDITIONAL LANE MILES OF CAPACITY ON ARTERIAL AND MAJOR COLLECTOR ROUTES,
* RE-ALIGNING FRONTAGE ROADS AWAY FROM FREEWAY RAMPS, TO REDUCE CONFLICTS, AND
* CONSTRUCTING GRADE SEPARATED CROSSINGS OF RAIL LINES ON HIGH USE ARTERIAL ROUTES.

METROPOLITAN GROWTH IS AFFECTING ALL TRANSPORTATION SERVICE. TRANSIT OPTIONS ARE BEING EXPLORED IN BIGGER SUBURBAN COUNTIES NEAR ATLANTA. OTHERS HAVE RECENTLY BEGUN ACTION TO UNDERTAKE TRANSIT STUDIES OF THEIR OWN. FOR THE LONG TERM, A COMBINATION OF HIGHWAY AND TRANSIT IMPROVEMENTS WILL BE NEEDED TO SERVE THESE GROWING DEMANDS.

FLEXIBILITY WILL BE A KEY FACTOR IN OUR FUTURE TRANSPORTATION RESPONSES FOR THESE AREAS. WE WILL NEED TO SEE THIS MATCHED IN THE FEDERAL PROGRAM AS WELL.

WE HAVE ALL READ AND HEARD THE LAMENT "OUR TRANSPORTATION SYSTEMS ARE BREAKING DOWN - QUALITY IS SERIOUSLY DECLINING."

A REPORT PREPARED BY THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO), DURING THE TRANSPORTATION 2020 EFFORT CONCLUDES WE SHOULD BE SPENDING CLOSE TO $100 BILLION A YEAR ON HIGHWAYS INSTEAD OF THE $66 BILLION WE CURRENTLY SPEND NATIONALLY.

WE HEAR THE FRUSTRATED CRY OF OUR CITIZENS AND BUSINESSES WHO CAN'T PROSPER BECAUSE THEY ARE LOCKED IN URBAN CONGESTION, OR THEY LACK ACCESS FROM OUR RURAL COMMUNITIES.

IT'S INCREDIBLE TO THINK THAT AS A NATION WE ARE LOSING $73 BILLION ANNUALLY IN PRODUCTIVITY DUE TO CONGESTION. THAT'S NEARLY 10 TIMES GEORGIA'S STATE BUDGET. IT IS ALSO ABOUT $7 BILLION MORE THAN ALL GOVERNMENTS COMBINED CURRENTLY SPEND ON HIGHWAYS IN THIS COUNTRY.

THE ADMINISTRATION IS PROMISING A NEW NATIONAL TRANSPORTATION POLICY AND A NEW SURFACE TRANSPORTATION ACT, (CURRENT ACT EXPIRES IN SEPTEMBER 1991).

WE HAVE ARGUED FOR SOME OF THE KEY ELEMENTS OF THIS NEW POLICY, FOR YEARS. WE ARE PLEASED TO SEE THEM.

PRESENTLY GEORGIA HAS MORE THAN $250 MILLION TIED UP IN APPORTIONMENTS UNSPENT DUE TO OBLIGATION CEILINGS IMPOSED ON FEDERAL SPENDING. IN TRANSITION TO A NEW PROGRAM, WE CANNOT FOREGO A YEAR OF AUTHORIZATION BECAUSE THESE EXIST. I HOPE, MR.

CHAIRMAN, THAT YOU AND THE COMMITTEE WILL ARGUE FOR RELEASING THIS MONEY IN THE 1991 HIGHWAY REAUTHORIZATION ACT. THE BALANCE IN THE TRUST FUND ALSO FUELS THE DESIRE TO USE MOTOR FUEL TAXES FOR DEFICIT REDUCTION. WE ARE STRONGLY OPPOSED TO THIS.

WE BELIEVE NEW AUTHORIZATION LEGISLATION SHOULD CORRECT THE INEQUITIES OF 85 PERCENT MINIMUM ALLOCATION. WE FAVOR CONTINUING SUPPORT FOR STATES WITH LARGE FEDERAL LANDS AND SPARSE POPULATIONS. BUT AS A HIGH GROWTH STATE WITH MANY NEEDS RELATED TO A SHORTAGE OF ROAD CAPACITY, WE FEEL THE FEDERAL PROGRAM CAN AND SHOULD SUPPORT AT LEAST A 90 TO 95 PERCENT RETURN ON GEORGIA'S HIGHWAY TRUST FUND COLLECTIONS. THE NEED FOR CASH SUBSIDIES TO THESE SPARSELY POPULATED AREAS TODAY FOR SYSTEM PRESERVATION IS NOT EQUAL TO THAT ORIGINALLY NEEDED TO BUILD THE INTERSTATE.

WE ARE STRONG SUPPORTERS OF THE CONCEPT OF A NEW TWO-TIERED FEDERAL PROGRAM THAT:

* FOCUSES ON SYSTEMS OF NATIONAL SIGNIFICANCE: DEFINES A NATIONAL HIGHWAY SYSTEM AND A NATIONAL TRANSIT SYSTEM,
* OFFERS GREATER FLEXIBILITY TO THE STATES FOR BOTH PROJECT DEVELOPMENT AND FUNDING UNDER A FLEXIBLE PROGRAM,
* RESTORES EQUITY TO FORMULA APPORTIONMENTS, WITH FACTORS BASED ON SYSTEM SIZE AND USE,
* EXPANDS AND BETTER COORDINATES SAFETY PROGRAMS, AND
* REVITALIZES THE ROLE OF RESEARCH AND TECHNOLOGICAL INNOVATION IN HELPING US PROVIDE BETTER FACILITIES AND

SERVICES.

INCREASED FLEXIBILITY CAN ALLOW US TO FOCUS ON STATE PRIORITIES ON ALL OUR SYSTEMS INSTEAD OF BEING RESTRICTED BY FEDERAL CATEGORICAL PROGRAM CONSTRAINTS.

WITH FLEXIBILITY WE COULD GAIN MORE DISCRETION OVER AS MUCH AS ONE-HALF OF OUR FEDERAL APPORTIONMENT ($380 MILLION, FY 90).

WITH THIS DISCRETION WE COULD ADDRESS ONE OF OUR CRITICAL STATE PRIORITIES FOR GREATER ACCESS TO FOSTER RURAL ECONOMIC DEVELOPMENT IN GEORGIA, (GOVERNOR'S ROAD IMPROVEMENT PROGRAM). WE HAVE ALREADY SPENT OVER ONE-HALF BILLION DOLLARS IN UNMATCHED STATE MONEY ON THIS PROGRAM. WE HAVE A LONG TERM COMMITMENT TO THIS PROGRAM.

WE SUPPORT FEDERAL POLICY SHIFTS THAT COULD LEAD TO REDUCED BARRIERS TO PRIVATE INVESTMENT IN TRANSPORTATION. I INCLUDE TOLL ROADS IN THIS CATEGORY.

WE SUPPORT THE CONCEPT OF A SYSTEM OF NATIONAL SIGNIFICANCE AND A FOCUSING OF THE FEDERAL ROLE.

WE ARE NOT ENCOURAGED BY FHWA'S RECENT EFFORTS TOWARD DESIGNATING A NATIONAL HIGHWAY SYSTEM, HOWEVER.

THE ORIGINAL LETTER FROM THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE IN MAY, REQUESTED FHWA TO DESIGNATE A PRELIMINARY NATIONAL HIGHWAY SYSTEM IN COOPERATION WITH AASHTO, THE STATES, LOCAL GOVERNMENTS AND MPO'S.

THE COMMITTEE ALSO REQUESTED IN THEIR LETTER THAT THE NEW NATIONAL HIGHWAY SYSTEM BE BASED ON THE 1989 FUNCTIONAL RECLASSIFICATION STUDY AND CRITERIA CONTAINED IN AASHTO'S "NEW CONCEPTS" REPORT.

UNFORTUNATELY, FHWA CHOSE TO DISCARD THE AASHTO CRITERIA AND ISSUE NEW STANDARDS FOR DESIGNATING THE SYSTEM.

THE APPARENT RESULTS OF FHWA'S APPROACH WILL BE THREE SYSTEMS MAPS SUBMITTED TO CONGRESS FOR CONSIDERATION.

THE SMALLEST OF THE SYSTEMS PROPOSED CONSISTS OF ONLY 120,000 MILES. GEORGIA REGARDS THIS SYSTEM AS TOTALLY INADEQUATE.

USING THE 120,000 MILE PROPOSAL, REFERRED TO AS THE BASIC SYSTEM, GEORGIA IS LEFT WITH 2408 MILES OF NATIONAL HIGHWAYS, A SYSTEM LESS THAN TWICE THE SIZE OF OUR PRESENT INTERSTATE SYSTEM.

THIS SYSTEM WOULD SERVE ONLY THREE PERCENT MORE TRAVEL (VMT) THAN IS ALREADY SERVED BY OUR INTERSTATE SYSTEM. AND THE LIMITED MILEAGE WOULD NECESSITATE SELECTION OF ROUTES MOST IN NEED OF IMPROVEMENT, RATHER THAN MOST IN DEGREE OF NATIONAL IMPORTANCE.

IN ADDITION, THE SYSTEM WOULD NOT ADEQUATELY SERVE DEFENSE REQUIREMENTS, (STRAHNET SYSTEM), AND WOULD NOT PROVIDE FOR CONNECTIVITY AT STATE LINES. NOR WOULD IT BRING ACCESS TO RURAL GEORGIA.

UNDER THE BASIC SYSTEM PROPOSAL, GEORGIA COULD SEE ITS AVERAGE PER MILE EXPENDITURE FOR OTHER SYSTEMS CUT BY NEARLY 57 PERCENT, BASED ON A 70/30 DISTRIBUTION OF HIGHWAY FUNDS BETWEEN A NATIONAL HIGHWAY PROGRAM AND A FLEXIBLE PROGRAM, WHICH IS BEING DISCUSSED BY FHWA.

THE LOGIC OF THIS APPROACH DOES NOT MAKE SENSE IF WE ARE CONCERNED ABOUT IMPROVING OUR HIGHWAY SYSTEMS. THE BASIC SYSTEM PROPOSED BY FHWA CLEARLY WILL NOT MEET OUR NEEDS.

THE FHWA'S SECOND LEVEL NATIONAL SYSTEM PROPOSAL CONSISTING OF 150,000 MILES IS AN IMPROVEMENT OVER THE BASIC SYSTEM. BUT EVEN THIS PROPOSAL WILL NOT ACCOMMODATE ALL STRAHNET ROUTES. NOR WILL IT ALLOW FOR RESOLUTION OF STATE LINE CONNECTIONS. ALSO, IT WOULD FORCE EXCLUSION OF SOME RECENTLY IMPROVED ROUTES, EVEN THOUGH THEY CARRY HIGH TRAFFIC VOLUMES.

THE THIRD LEVEL SYSTEM, THE OPTIONAL SYSTEM WHICH GEORGIA HAS PROPOSED, WOULD CONSIST OF APPROXIMATELY 200,000 MILES NATIONALLY. THIS SYSTEM WOULD TRANSLATE INTO THE ROUGH EQUIVALENT TO A REDEFINED PRINCIPAL ARTERIAL SYSTEM. IT CAN ADEQUATELY SERVE STATE, NATIONAL DEFENSE AND STATE LINE

CONNECTIVITY NEEDS.

I WISH TO EMPHASIZE HOWEVER, THAT WE CANNOT ACCEPT THE TWO SYSTEMS SUGGESTED BY FHWA. WE DEFINITELY NEED MORE STUDY BEFORE A FINAL SYSTEM IS SELECTED.

WE WOULD HOPE THAT CONGRESS WOULD ENDORSE THROUGH LEGISLATION THE CONCEPT OF A NATIONAL HIGHWAY SYSTEM AND FLEX PROGRAM. IF THIS OCCURS, THEN THE PROPOSED NATIONAL SYSTEM IN EACH STATE SHOULD BE BROAD ENOUGH TO ALLOW US TO ADDRESS STATE PRIORITIES. IN GEORGIA, WE WOULD NEED A SYSTEM WHICH WOULD INCLUDE UP TO 2100 URBAN AND 3900 RURAL MILES.

THE NATIONAL HIGHWAY SYSTEM DOES NOT NEED TO BE A SMALL INTERSTATE - TYPE, LIMITED - ACCESS NETWORK. DESIGN CRITERIA SHOULD BE BASED MORE ON SERVICE REQUIREMENTS. SOME OF THESE ROUTES COULD VERY WELL BE TWO-LANE HIGHWAYS, BUT STILL SERVE A NATIONAL PURPOSE.

ANOTHER OF OUR CONCERNS WITH THE FEDERAL-AID PROGRAM IS FUNDING. CURRENT APPORTIONMENT FORMULAS DO NOT PROVIDE A REASONABLE RETURN TO ALL STATES OF TRUST FUND CONTRIBUTIONS.

NOT ONLY THAT, THE CURRENT FORMULAS ARE FRAUGHT WITH OUTMODED OR OUTDATED FACTORS THAT BEAR NO REAL RELATIONSHIP TO TRANSPORTATION NEED. SOME ARE IMPRECISE AND SUBJECT TO MANIPULATION. OTHER FACTORS ARE POOR SUBSTITUTES FOR MORE RELEVANT VARIABLES.

GEORGIA RECEIVES A RETURN OF APPROXIMATELY 70 CENTS ON THE DOLLAR FROM PRESENT FORMULAS, NOT COUNTING MINIMUM ALLOCATION.

NEW FORMULAS SHOULD PROVIDE STATES A MINIMUM 90 TO 95 PERCENT RETURN ON TRUST FUND CONTRIBUTIONS. THE FORMULAS SHOULD PROVIDE EQUITY WITHOUT USE OF THE ARTIFICIAL FLOORS OF MINIMUM ALLOCATION. FACTORS SUCH AS LAND AREA, POSTAL ROUTE MILEAGE, COST-TO-COMPLETE AND POPULATION SHOULD BE DISCARDED IN FAVOR OF FACTORS THAT REPRESENT BETTER MEASURES OF NEED AND USE, SUCH AS VMT, LANE MILES, AND DIESEL FUEL CONSUMPTION.

FACTORS SHOULD BE RELIABLE, CONSISTENT AND NOT SUBJECT TO MANIPULATION. THEY SHOULD BE BASED ON STATISTICS THAT ARE, OR CAN BE, EASILY MEASURED, AND HAVE UNIFORMITY FROM STATE TO STATE.

HOLD-HARMLESS PROVISIONS SHOULD BE INCLUDED, SO THAT NO STATE LOSES FUNDS AT PRESENT PROGRAM LEVELS, EVEN IF THEIR PERCENTAGE APPORTIONMENT OF NEW FUNDS SHOULD DECREASE.

THE FEDERAL PROGRAMS SHOULD BE DIVIDED EQUALLY, WITH 50 PERCENT GOING TO THE HIGHWAY SYSTEM OF NATIONAL SIGNIFICANCE AND 50 PERCENT TO THE FLEXIBLE PROGRAM FOR OTHER ROUTES.

WE ALSO BELIEVE THAT BRIDGE REPLACEMENTS AND RECONSTRUCTION SHOULD BE FUNDED FROM NATIONAL HIGHWAY SYSTEM AND FLEXIBLE PROGRAM APPORTIONMENTS, AND NOT FROM SEPARATE BRIDGE PROGRAMS. WE WOULD FAVOR ESTABLISHING MINIMUM EXPENDITURE FLOORS FOR

BRIDGES IN THESE APPORTIONMENTS, HOWEVER.

THE FHWA HAS PROPOSED A DETAILED CONGESTION MANAGEMENT APPROACH TO URBAN AREAS. WE FEEL SOME ELEMENTS OF THIS COULD BE WORTHWHILE. HOWEVER, WE ARE DISTURBED BY SOME OF THE DETAILS OF THIS PROPOSAL. STRICT COMPLIANCE WITH ALL THE PROVISIONS COULD LEAD US INTO ENDLESS LITIGATION.

FINALLY, WE ARE ANTICIPATING MOVES TO INCREASE THE SIZE AND WEIGHT LIMITS OF LARGE TRUCKS. ASIDE FROM OUR CONCERNS ABOUT OVERSTRESSES ON THE HIGHWAY SYSTEM, WE BELIEVE THIS COULD LEAD TO EXCESSIVE SHIFTS OF FREIGHT FROM RAIL TO TRUCKS. IMPROVING THE MARKET ADVANTAGE OF TRUCKING IN THIS WAY IS NOT IN THE OVERALL BEST INTEREST OF THE COUNTRY, IN MY OPINION. COMPETITIVE POSITION SHOULD BE BASED ON MARKET EFFICIENCY AND NOT LEGISLATED. I BELIEVE A DESIRABLE BALANCE IN TRUCK VERSUS RAIL SHIPPING ALREADY EXISTS.

IN CONCLUSION, IT IS DISTURBING TO HEAR ABOUT CRUMBLING ROADS AND BRIDGES AND ABOUT BILLIONS OF DOLLARS IN LOST PRODUCTIVITY DUE TO CONGESTION, AND RECALL THAT THERE ARE BILLIONS ($10.3 BILLIONS) OF UNSPENT DOLLARS IN THE HIGHWAY TRUST FUND THAT COULD BE PUT TO USE TO SOLVE URGENT TRANSPORTATION NEEDS. THIS IS A GREAT MISMATCH IN OUR PRIORITIES.

IT STRETCHES OUR BELIEF EVEN MORE TO FACE THESE URGENT NEEDS AND TALK OF INCREASING MOTOR FUEL TAXES TO REDUCE THE FEDERAL DEFICIT. ANY INCREASE IN THE FEDERAL MOTOR FUEL TAX MUST BE USED FOR TRANSPORTATION, AND MUST NOT PRE-EMPT STATES FROM BEING ABLE TO MATCH FEDERAL FUNDS.

IF WE ARE GOING TO CREATE A SYSTEM OF NATIONAL SIGNIFICANCE, LET'S CREATE FUNDING OF NATIONAL SIGNIFICANCE, ADEQUATE FEDERAL FUNDING TO EXPAND, PRESERVE AND MAINTAIN A NATIONAL TRANSPORTATION SYSTEM.

GEORGIA STRONGLY SUPPORTS THE AASHTO RECOMMENDATIONS FOR INCREASING FEDERAL HIGHWAY FUNDING TO $17.6 BILLION IN FISCAL YEAR 1992 AND INCREASING TO $25.9 BILLION IN FISCAL YEAR 1995, AND INCREASING FEDERAL TRANSIT CAPITAL FUNDING FROM $3.2 BILLION TO $5.0 BILLION OVER THE SAME PERIOD.

FINALLY, IF WE ARE GOING TO OFFER FLEXIBILITY TO STATE AND LOCAL GOVERNMENTS, LET'S DO IT PROPERLY. LET'S NOT REPLACE RIGID PROJECT REQUIREMENTS WITH EQUALLY RIGID PERFORMANCE CRITERIA.

I HAVE READ THAT WE HAVE MORE THAN $5 TRILLION INVESTED IN TRANSPORTATION IN THIS COUNTRY. THAT INCLUDES THE SUM TOTAL OF PUBLIC AND PRIVATE INVESTMENTS IN ALL FORMS OF TRANSPORTATION.

THIS INVESTMENT REPRESENTS A SHARED RESPONSIBILITY - A TRUE PARTNERSHIP OF CITIZENS, BUSINESSES AND GOVERNMENTS. LET'S REMEMBER WE FACE GREAT CHALLENGES AND OPPORTUNITIES IN THE COMING DECADES.

I BELIEVE WE MUST TAKE STEPS NOW TO INVEST IN OUR FUTURE.

THANK YOU MR. CHAIRMAN

TESTIMONY

before
the
SURFACE TRANSPORTATION SUBCOMMITTEE
of the
HOUSE PUBLIC WORKS COMMITTEE

on
REAUTHORIZATION
of the
SURFACE TRANSPORTATION ACT

September 21, 1990
Field Hearing

presented by
Dorothy H. Sparrow, Director
Kerr Area Rural Transit System

TESTIMONY BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

Committee on Public Works and Transportation

FIELD HEARING

Friday, September 21, 1990

The process of reauthorizing our federal transit legislation via the Surface Transportation Act, and field hearings like this conducted by the subcommittee, gives us an excellent opportunity to reassess our existing policies and to respond to the changes that have occurred in our transportation needs since the last reauthorization. On behalf of Community Transportation Association of America (CTAA), the North Carolina Public Transportation Association, of which I serve as Secretary/Treasurer, Kerr Area Rural Transit System (KARTS) where I am Executive Director, and the rural people of our state, I am excited about the opportunity to emphasize our needs. I also greatly appreciate the opportunity to specify points I believe should be given higher priority.

Prior to the 1980's, there was little recognition that rural areas might have transit needs. Now there is growing awareness that the rural communities represent at least a third of all the people who can be considered transit dependent because of their lack of access to adequate private transportation resources such as a family automobile. I am convinced that rural transportation needs are so much greater than those of our urban brethren. Rural residents are often isolated to the point that public transportation is their ONLY life line or link to

even modest amenities. By modest, I refer to a hot meal once or twice a week; a means to seek medical assistance, buy meager groceries or to wash their clothes. More importantly, a means to seek assistance from social service agencies, to receive training or education, and even to receive dialysis to maintain their existence. Had I been given more time to prepare to talk to you, I could have provided you a pictorial witness to these individuals and a brief narrative of their needs.

KARTS is a coordinated public rural transit system that serves the citizens of a five-county area (Franklin, Granville, Person, Vance and Warren) with a population of 160,000+. We contract with over 25 human service agencies, the local community college, as well as serve the public in general who are transportation needy. With a fleet of 40 vehicles, it requires driving nearly 800,000 miles a year to provide approximately 150,000 trips. While we are in a position to help many, there are still more that need our service. With the initiation of the JOBS program, our capital needs will become inadequate to handle the increase without federal funding assistance. Without our transportation service, how and where will the social service agencies buy or secure transportation to meet the needs for the JOBS program and help to remove these people from dependency on welfare?

Enactment of the Section 18 program clearly demonstrated that mobility needs are real and extensive in rural areas. Provision of public transit outside urbanized areas has grown substantially in the last decade. Despite this dramatic growth, it is estimated that current transit service in rural areas is adequate to serve only about

one-tenth of the basic transportation needs of an isolated and transit dependent population. Reauthorization of the Surface Transportation Act gives us all the opportunity to do something about this deficit.

During the 80's, our federal partner has withdrawn its financial support --- dwindling from 80% to 100% in many cases to no operating assistance, and the reduction in administrative and capital assistance from 20% to 40%. While federal assistance has become less and/or stagnant, costs are skyrocketing (i.e. fuel, capital acquisitions, labor for repair and maintenance). Stiffer mobility requirements is creating our inability to keep up with capital needs.

During the reauthorization, please remember the high priority of the rural needs and the inadequacies of the funding ratio as it is now. The following points, in my opinion, should be included as you analyze and debate the many crucial issues which must be considered as you develop a new federal surface transportation program:

(1) The inequity of distribution of federal resources whereby 2.93% goes to rural and small urban while in reality a more equitable percentage should be proportionately closer to the actual rural/urban population split.

(2) I believe rural isolation is more damaging than urban isolation since it is often impossible for rural citizens to access medical services, jobs and even to training and education.

(3) The American Disabilities Act (ADA), I feel, impacts costs that are unfair and unattainable. The 40% increase to the cost of every transit vehicle is an unnecessary requirement when our our present percentage of mobility equipment meets the present need with prior scheduling. Who will finance that additional cost??

(4) Please consider more human service coordination. While KARTS does a good job in this for our area, as does most of North Carolina, this is not true in other states. The new Family Support Act, the JOBS program, and HEAD START should be coordinated for maximum cost effectiveness.

(5) More equity should be considered in Mass Transit Account formula. I feel strongly that a higher ratio of our state money should be kept in North Carolina to ensure our rural people can access life lines rather than go to urban areas to decrease commuter time for those not dependent on public transportation.

I believe that a reauthorization of transit programs/federal assistance that includes these elements above listed will give federal transit investment the higher priority that events today demand and that our rural citizenship deserves.

I really appreciate your coming to our state (North Carolina) to hear our concerns, and I do not underestimate the enormity nor the

difficulty of the task before you. I humbly ask that the issues I've raised be considered in your process of reauthorization.

On behalf of CTAA, NCPTA, and myself, thank you for this opportunity to express our views. If we can be of further assistance to you, we offer it eagerly. I will be glad to try to respond to any questions you may have.

Remarks by
The Honorable Avery Upchurch, Mayor, Raleigh, North Carolina

Before the US House of Representatives
Public Works And Transportation Committee
Subcommittee on Surface Transportation Field Hearing

September 21, 1990
Research Triangle Park, North Carolina

Mr. Chairman, Congressman Valentine, Congressman Schuster, Ladies and Gentlemen, I am Avery Upchurch, mayor of Raleigh, North Carolina's capital city. I am pleased to speak to your subcommittee members this morning, based on my experience with transportation issues in one of North Carolina's metropolitan areas. I believe our city's large population, its dominant role in the greater urban and regional setting, and its proximity to state government qualify us to understand the transportation needs of the modern city.

On the one hand our problems are based on magnitude: urban congestion, safety, air quality. On the other hand the problems relate to the legislative process: highway funding and the flexibility of regulations concerning that funding.

What are the highway concerns of the modern city? Our experience shows several, including

- making accurate needs projections in the face of shifting demographics
- a growing gap between urban jobs and existing transportation systems for suburban areas
- increased urban and suburban congestion
- growing maintenance needs as capital projects reach the end of their design life
- rising public transit operating costs, and
- federal mandates for transportation programs to reduce air pollution.

We know that these problems are to be solved in the context of fewer federal transportation dollars. Certainly, we can make the case for more federal funding. North Carolina is among the most populous states in the nation. We have the largest network of state-maintained highways in the country. We are doing so much to meet national goals on our own and we're raising taxes to do it. Yet we continue to be a donor state in terms of transportation dollars sent to Washington compared to program dollars returned to Raleigh and its sister cities across the state. Equity alone demands that some way be found to more adequately match need with resources available.

We have already made and won the case for more state and local spending. We have just embarked on a major highway building program in North Carolina that will infuse more than $9 billion in new money over the next several years for important highway needs in the state. North Carolina cities and towns spend more than $283 million annually on streets and transportation. This is over and above the $80 million they receive from state gasoline tax funding, so you can see that the local investment is substantial.

What we need now is a partner, not only in funding but in understanding the program needs we have.

We encourage a major increase in highway funding if that can be accomplished within the context of managing the federal deficit reduction. Those numbers are really up to you. But the way we see it, it's really quite simple. Infrastructure improvements increase the country's productivity in greater proportion that the dollars spent. The continuing concern over the short-to-mid term economy may factor into the need for this program. [I will offer one small piece of advice as you determine where money can be found to fund highways. It will be difficult to convince most people of the need to raise additional, new transportation tax dollars before the billions of Highway Trust Fund tax dollars are spent down.]

FUNDING FLEXIBILITY

Almost as important as funding is to us at the local level, is a problem that Congress can more easily address: providing flexibility in spending the federal funds you provide. Nothing is more frustrating to officials and citizens, or makes a centralized government appear more ineffectual, than to have money available that cannot be spent on obvious needs. To offer a lug wrench to a traveller who is out of gas is foolishness at its height.

Mr. Mineta, you have been a mayor and you know the importance of funding flexibility at the local and state level. If the Congress truly wants to improve transportation, make that funding flexible like a block grant. Make it so we can spend it with local needs in mind, so long as we satisfy you that we are meeting the national goals you have set out. Don't pigeon-hole the money so that it must be spent on lower priority needs just to meet standardized goals.

The block grant concept is more in line with the realities of transportation needs funding throughout the country. You cannot expect the variety of circumstances in size, needs, and investment to be met by a single national program that targets its funding in such a narrow way. I feel your emphasis should be more on meeting the goals, not so much in how the goals are met.

Current highway funding categories are too restrictive and do not correspond to where local officials know and understand the problems are. I urge you to let us match the funds with the problems. If we are allowed to do this, we can better meet the problems of congestion, safety, and air quality, with solutions like outer beltways, pollution controls, urban and rural access roads and the like.

CONTINUE THE MPO PROCESS

You've heard of the 3 Rs, let me mention the 3 Cs. We enjoy an excellent relationship with the state DOT in the 3 C planning process: continuing, comprehensive and cooperative planning as it is known. As chairman of my own area's Transportation Advisory Committee I can speak directly and earnestly for the value of this process. I believe in the fundamental responsibility for transportation planning and decision-making being placed at the state and local level.

In North Carolina, we have had a good experience with the Metropolitan Planning Organization (MPO) process. This process has brought all transportation actors together to develop and agree on priorities, plans, work programs, and improvement schedules. The federal government should continue the MPO, and ensure that transportation plans support both local objectives and satisfy local needs.

SUPPORT URBAN CONGESTION MANAGEMENT

Along the same lines I have discussed with this theme of flexibility, we support the preliminary urban congestion management system proposed.. For a populous city like Raleigh, where we function as the major metropolitan hub for this part of the state, we encourage the flexibility outlined in this plan. We feel that it will help us relieve congestion, air pollution, and reduce energy consumption by recognizing locally-determined practical applications and technological solutions to problems. An example of this flexibility as applied to energy savings is the opportunity to pay for a highway interchange instead of a highway intersection.

In conclusion, we **WOULD LIKE** more money with fewer strings. What we **MAY GET** is more money with more strings. But if you decide to **KEEP** the money...then **KEEP** the strings.

Thank you for this opportunity and good luck in your deliberations on this important bill.

TESTIMONY OF

FRANK E. WILLIS

CAROLINAS ASSOCIATED GENERAL CONTRACTORS

Presented to the
Surface Transportation Subcommittee
United States House of Representatives
September 21, 1990

Reauthorization of the Post-Interstate
Surface Transportation Programs

Regional Field Hearing at
Microelectronics Center of North Carolina
Research Triangle Park
Durham, North Carolina

Carolinas Associated General Contractors
1100 Euclid Avenue, Charlotte, North Carolina 28203-4522

Mr. Chairman, Members of the Subcommittee and Ladies and Gentlemen. My name is Frank Willis of Willis Construction Company in Florence, South Carolina. Willis Construction Company is a small family held business engaged in highway construction. I am past president of Carolinas AGC and current Highway Division Chairman of the Associated General Contractors of America. Carolinas AGC represents more than 3,600 firms that perform more than eighty percent of the Carolinas construction of highways, bridges, commercial buildings, industrial and municipal utility facilities.

Carolinas AGC appreciates the opportunity to express its views on the major issues facing the nation in surface transportation. As the nation's leading construction trade association, AGC is vitally concerned with adequate investment in our nation's surface transportation infrastructure to provide the foundation for continued economic prosperity and international competitiveness. AGC applauds this Subcommittee for scheduling this regional hearing in the Carolinas and getting on with the important task of reauthorizing the nation's highway and mass transit programs.

Recognizing that construction of the Interstate Highway System will be essentially complete in the early 1990s, America is at a crossroads with regard to its future transportation policy. In March of 1989 AGC adopted a series of policy recommendations relating to future surface transportation legislation. Following is a discussion of some of the major issues and policy recommendations which AGC believes should be considered as part of the future surface transportation legislation.

AGC believes that transportation infrastructure is at the very heart of what makes this country thrive and prosper. Over the past 30 years the gross national product of this country has grown over 1,000 percent, nearly double the increase of the previous 30-year period in our history. Several factors account for this growth. One factor, highway development, stands out above all others. America has grown and prospered from the mobility provided by the nation's highway transportation system, in general, and specifically the Interstate Highway System. A look at the role of our highway system in our economy will show the magnitude of its effect on current and future economic development.

- 89.5 percent of all personal travel is on highways;
- 82 percent of all freight revenues are carried on highways; nearly every product manufactured or consumed in this country is, for a portion of its journey from production to market carried by truck; and
- 85 percent of America's workers commute to work by private vehicle.

Clearly, highways play a vital role in our economy. No commercial, industrial, retail, or residential development would

have been built in a location that did not provide for an adequate highway system to support it.

As development patterns have changed, highways have played an even more important role in this country. Development over the past 20 years has shifted substantially to suburban growth centers. Suburban employment currently accounts for 60 percent of metropolitan jobs, 47 percent of all job destinations, and 67 percent of all job growth in this country. America is increasingly working in commercial buildings, industrial complexes, and shopping centers in suburban areas. None of these suburban developments would have been possible without an adequate highway transportation system serving them.

Increasingly, communities around this country are recognizing the critical link between highways and economic development. Recently, North Carolina voted a multi-billion dollar road development program designed to support the state's rapid economic development. A critical factor in the tremendous building boom in the suburban Washington, DC areas of Fairfax County, Virginia, has been access to highway transportation. This same link between highways and building is being played out in growth areas across the country.

Unfortunately, some tend to take our highway system for granted. Indeed, like other aspects of our nation's infrastructure, some rarely acknowledge the vital role that highways play in their daily lives, until the highway system breaks down.

There are already signs our highway system is wearing out. The tremendous highway investment made over the past 35 years has been a great success. Our highway network has carried traffic far beyond its design life, as Americans have enjoyed the rewards of mobility unknown to most of the rest of the world. This success, however, has taken its toll as we fail to adequately reinvest in our highway system. Many portions of the Interstate system are in need of repair and reconstruction; nearly 50 percent of the nation's bridges are structurally deficient or obsolete; and congestion on urban freeways is increasing at an alarming rate.

A central question facing the Congress as it begins to develop its future surface transportation legislation is how to ensure adequate investment in the nation's transportation infrastructure to meet current and future demands for economic growth. AGC believes that this nation is seriously under investing in its transportation infrastructure, at a great cost to the nation in

38-253 O—91——107

lost productivity, jobs, and international competitiveness. The nation's transportation system is the arterial system by which the country's economic development is nurtured and supported. If the people of this country, both public officials and private citizens alike, continue to ignore the construction and rehabilitation of this nation's highways, the congestion in the nation's airports and airways, our nation will pay many times over in lost economic opportunity now and in the future.

AGC urges the federal government to assume the necessary leadership role to promote adequate transportation capital investment by all levels of government.

Statistics show that US spending on public works projects has declined significantly as a percentage of total governmental expenditures. In 1950, 19.1 percent of government expenditures went to public works, by 1984, the figure dropped to 6.8 percent. This comes at a time that US motorists experienced over 700 million hours of delay on highway -- wasting nearly 3 billion gallons of gasoline as a result. The projected congestion of 3.9 billion hours of delay by 2005 is staggering.

The most in-depth analysis of highway needs was performed in 1988 by the American ASsociation of State Highway and Transportation Officials (AASHTO). In their report entitled "The Bottom Line -- A Summary of the Surface Transportation Investment Requirements 1988 - 2020", AASHTO identified annual highway capital investment needs, by all levels of government, of up to $58.5 billion between now and the year 2020. This compares with highway capital spending in 1987 of only $31 billion.

As a follow-on to the Bottom Line report, AASHTO developed and published policy recommendations in a report entitled "New Transportation Concepts for a New Century". While there are a number of policy recommendations contained in that report that are worthy of this Subcommittee's consideration, AGC would like to particularly highlight their recommendation to significantly increase federal funding for the nation's highway program. AASHTO is recommending that highway spending be set at $17.6 billion in FY 1992 increasing to $25.9 billion by FY 1995. As the Subcommittee is aware, highway spending this fiscal year was just over $13 billion.

AGC believes this recommendation recognizes the need to significantly increase highway investment by all levels of government and continues the strong federal role necessary to preserve the nation's Interstate Highway System and meet the other

pressing highway and bridge needs. The proposal further recognizes that the federal-aid highway program is a partnership between the federal and state governments, and attempts to maintain the current balance of financial responsibilities by continuing the traditional 40 percent federal share of meeting highway capital needs. In the context of overall expenses -- capital, maintenance and operation costs -- the AASHTO proposal will require states to finance 75 percent of the future highway system requirements. Recognizing that states need some time to develop projects and to come up with matching funds, the proposal phases in growth of the program.

AGC applauds the work of AASHTO as part of the Transportation 2020 program and encourages the Congress to consider AASHTO's policy recommendations on future funding as a sound basis on which to begin debate and build the future legislation.

The challenges facing this country in transportation are immense, but not insurmountable. The federal programs supporting the nation's surface transportation are basically sound, providing a solid framework to address the challenges of the future. As the Subcommittee considers the future surface transportation legislation, AGC believes there are a number of important concepts of the current program which are critical to the success of surface transportation programs in the future. The most critical of which is the user fee - trust fund concept. The trust fund concept has long been recognized as a reliable and stable financing mechanism for infrastructure investment. Several key features of the trust fund are largely responsible for its success. First it is user-fee financed -- the nation's highway transportation system is paid for only by the user. The more you use the system the more you pay. The public support for the highway program has remained strong primarily because the traveling public receives a direct benefit from the money it pays in user fees. Another key aspect of the trust fund is that it provides a stable and reliable financing mechanism on which a successful, major capital investment program must depend. A typical highway project may take 7 to 10 years from the planning stage to completion. Proper planning for the transportation needs of the future requires that a dependable source of revenue will be available to finance the needed improvements when they are ready for construction. The multi-year authorization process and contract authority are critical ingredients to permit for this long term planning and assure the highway program's success.

AGC strongly recommends that Congress continue and strengthen the highway user fee financed trust fund.

Frank Willis Testimony before
House Surface Transportation Subcommittee
September 21, 1990

AGC recognizes the need, highlighted by the current Middle East crisis, for a national energy policy. It is obvious we must develop alternative fuel systems which may jeopardize our current motor fuel tax dependency for highway improvements. Today, gasohol users pay only one-third of the normal 9 cent per gallon federal tax. In effect, highway users of gasohol are not paying their fair share to build and maintain the system they are using. AGC strongly supports our nation's energy independence, however subsidies for alternate fuels should not be placed at the feet of the highway user.

We recommend that Congress reject proposals to increase motor fuel taxes for deficit reduction or other non-transportation spending. We support Congressional efforts to increase funding for the nation's highway system by spending down the trust fund balance and elimination of the highway use tax exemption for gasohol and other alternate fuels.

Both North Carolina and South Carolina continue to send more transportation dollars to Washington than is returned. North Carolina ranks near dead last in the donor category. The current national highway program, through its maze of funding categories and antiquated distribution formulas, denies some of the most populous and fastest growing states of a sufficient share of federal funds to address highway needs created by that same growth. Carolinas AGC supports the minimum allocation to donor states and recommends that a more equitable variables be included in apportionment formulas that would address vehicle miles of travel, fuel consumption and miles of state system routes. Carolinas AGC also urges Congress to support a concept of two major highway programs: a categorical program to support a highway system designated as national significance and a flexible program to be used at the discretion of the states to address highway needs not a part of the national system.

While the trust fund mechanism has worked well in funding transportation programs, the current budget process inhibits the expenditure of the trust fund receipts for their intended purpose. AGC views the trust fund and the highway program in the context of an ongoing capital investment program which should be subject to different rule than the current budget allows. AGC believes the manner in which the transportation trust funds are treated in the budget process needs to be modified.

The budget problems which have faced this country since the late 1960's, however, have had a detrimental effect on the ability of the federal government to let the trust fund work in the manner

in which it was intended. Since 1969, artificial spending restraints have caused the Highway Trust Fund balance to grow dramatically to a current balance of over $15 billion, including the mass transit account.

A first step in addressing this issue would be to expend the trust fund balances for their intended purposes. Since the trust fund receipts can be used for no other purpose than transportation, bankrolling these trust funds is not only a breach of faith with the transportation users of this country, but is merely postponing work that should be done now to prevent more costly repairs later.

A longer term solution to this issue is to take the trust funds out of the unified budget. These programs have not contributed to the deficit. The large cash balances are the very proof of that. The user-fee financed transportation programs of this country should be funded at the level their trust funds can support. The receipts should not be loaned to other programs while vital transportation needs of this country are neglected.

AGC continues to endorse the House Public Works and Transportation Committee's Initiatives to take the transportation trust funds out of the unified budget process.

In closing, AGC acknowledges that the Congress faces a tremendous challenge in balancing priorities in the reauthorization of the post-interstate surface transportation legislation. Only when transportation is given top priority can we as a Nation begin to address our transportation needs to ensure future growth, competitiveness and strength.

Thank you again for the opportunity to appear before you today.

FLORIDA DEPARTMENT OF TRANSPORTATION
605 Suwannee Street, Tallahassee, Florida 32399-0450

Testimony of
Harold W. Worrall, P.E.
Assistant Secretary for Finance and Administration
Florida Department of Transportation
605 Suwannee Street, MS 57
Tallahassee, Florida 32399-0450
(904) 488-3054

before the
Subcommittee on Surface Transportation
Committee on Public Works and Transportation
U.S. House of Representatives

Friday, September 21, 1990
Durham, North Carolina

Thank you for the opportunity to testify concerning the future of the Federal-aid Surface Transportation program and related issues. I am pleased to be with you today representing the Florida Department of Transportation.

At the outset, I wish to commend the Surface Transportation Subcommittee on its willingness to conduct a regional field hearing in the southeastern portion of the United States. During the upcoming reauthorization of the Surface Transportation Act, the diverse needs of all states, including those in the southeast, must be addressed in an equitable fashion. We at the Florida Department of Transportation are hopeful that today's hearing will serve as a vital step toward achieving this important goal.

The Federal-aid surface transportation program is one of the most important programs in this nation. Since its origin in 1916, and particularly with the creation of the Interstate Highway system in 1956, the Federal-aid highway program has had a profound affect upon life in America. Likewise, the federal involvement in transit programs, which began in 1964, has proven to be essential to the preservation of public transit service throughout the country.

But today, American transportation stands at a crossroads. As a variety of international events have demonstrated over the past year, the world is changing dramatically and the United States must change with it. Programs designed for the 1950's simply won't serve America in the 1990's and beyond. It's time for innovative thinking to modernize the national transportation program.

Over the next year, this Committee will have the opportunity to help frame the most important transportation legislation in nearly 40 years. It is critically important that in the new federal legislation our nation's transportation system will be afforded the ability to keep pace with the expanding needs of growth states like Florida. Significant change in Federal funding formulas and program structures must be brought about. Next year's Surface Transportation Act reauthorization provides the vehicle for this vital change.

Florida has documented its recommendations for some of these proposed changes in a brief report entitled "Transportation 2020: Ideas for the 21st Century.....Florida's Future Depends On It." This report, which accompanies my testimony today, makes three basic recommendations and then provides a rational justification for each.

These recommendations were not devised in a vacuum, nor within the narrow scope of Florida's geographic limits. Rather, they were developed in concert with state transportation officials from around the nation.

These 3 recommendations are of such fundamental importance to the improvement of American transportation that they could quite appropriately be referred to as the **"3 R's of Transportation."** Instead of the traditional grade school "Reading, 'Riting, and 'Rithmatic," these "3 R's are **"Raise, Restructure, and Revise."**

First: Raise transportation funding over a period of years by reducing the balance in the Federal Highway Trust Fund.

The existing anti-deficit provision of the Trust Fund, known as the Byrd Amendment, will ensure that spending down the uncommitted balance of the Fund will not jeopardize its financial solvency. According to a 1989 report by the U.S. General Accounting Office, Federal highway commitments could be increased by $7.4 billion without violating the Trust Fund's protection provisions.

Second: Restructure the overall federal transportation partnership and program to use more efficiently whatever level of federal funding is available. We firmly believe that the 60 or more current Federal funding categories should be consolidated into a more focused and greatly simplified program.

The Florida DOT joins the American Association of State Highway and Transportation Officials (AASHTO) in advocating a two-tier surface transportation system.

The first tier is a highway "system of national significance." This system would be designed to meet the principal interstate commerce and mobility requirements of the nation.

The second tier is a "flexible" highway program. This element is intended to give state and local governments the flexibility to meet their distinct highway needs. The focus would be on urban mobility, suburban commuting, rural access and modal interlinks.

Third: Revise the current formulas which disperse transportation funds to the states to more accurately reflect today's transportation needs, and provide greater equity in returning tax payments to the states where they are collected.

Because allocation formulas direct the distribution of transportation money, they are the key to the entire program. Consolidation of programs into two categories would be a giant step in the right direction. But without revisions in the allocation formulas, the merging of federal programs could render the present formulas even more obsolete and unfair.

Unbelievably, some of the present highway funding formulas are still based on such antiquated factors as rural postal delivery route mileage. This remnant of the 1920's may have made sense seventy years ago when the Federal government was primarily concerned with getting the farmer and the mailman out of the mud, but it clearly doesn't in today's world.

Simply put, the new emphasis must be on easing traffic congestion in our urban areas and moving commerce between our cities. Therefore, we support AASHTO's recommendations for revised Federal funding formulas. Florida, along with several other states, have also advanced the AASHTO process one step further by advocating a specific allocation formula. The short "white paper" entitled "Federal Highway Financing, 'Who Gets What'," also included with my testimony, provides further explanation of this recommendation.

While we do not claim to have arrived at the "perfect" allocation formula, our formula does provide a rational and equitable method for distributing Federal Highway Trust Fund dollars. However, like beauty, equity is often found in the eye of the beholder. In view of this fact, the Subcommittee may wish to review the projected levels of Minimum Allocation funds in any of the proposed allocation formulas yet advanced, in order to arrive at a less subjective definition of equity.

Originally created in the 1982 Surface Transportation Act, the Minimum Allocation (MA) supplement now includes some 19 states at an annual cost of approximately One Billion dollars. In Florida's view, the size of the MA program is a clear indicator of the current program's inequity. Consequently, we believe that those proposed formulas which reduce the number of MA states and the total cost of the MA supplement should be logically viewed as being more equitable.

Although formulas proposed by some western states would indeed cut the number of MA states about in half and reduce the cost to the $300-$500 million range, our formula would leave only two MA states with a cost of less than one-half million dollars! In the State of Florida's opinion, such a formula should clearly be considered "equitable." Furthermore, each of the factors used in Florida's formula proposal have a rational basis for determining the distribution federal transportation funds.

Of course, any new formula invites the question of who wins and who loses. We, in Florida, recognize the need for a nation-wide program that seeks to protect the interests of all states, including sparsely populated states. For that reason Florida has endorsed two specific provisions adopted by AASHTO through its consensus building process known as Transportation 2020. These two ideas are: 1.) a provision guaranteeing that every state would receive at least as much in total federal highway funding under the new program as it received in fiscal year 1991 (a "hold harmless"), and 2.) the related concept that each state, including those on "hold harmless," would enjoy some share of total federal highway funding growth.

Having paid $689 million into the Highway Trust Fund in FY 1989, and only received back $355 million in FY 1990 (representing a return of just 52 cents for every dollar sent to the Trust Fund!), we firmly believe it's time for a program that addresses the needs of all states by providing a fairer return on our contributions. Also restructuring of the Federal-aid program is necessary to recognize the unique transportation needs in all states. Clearly, the time has passed when we in Florida can tolerate a program which benefits the few at the expense of the many.

Let's design a new Federal-aid program to match the exciting challenges of the 21st Century. If we are to meet the needs of tomorrow, we need the same kind of boldness present in 1956 when the Interstate System began. A band-aid approach of "patching up" the current programs is simply incapable of carrying us into the next century.

We at the Florida DOT solicit your consideration of and support for the recommendations contained in our testimony and the accompanying materials. We look forward to actively working with you and your staff to enact these important proposals into law.

Thank you again for the opportunity to testify here today.

FEDERAL HIGHWAY FINANCING "Who Gets What"

New funding formulas have been developed for the Post-Interstate federal highway era. This paper explains why they are needed and how they would work.

WHY IS A NEW FORMULA NEEDED?

Attachment A illustrates the complexity of present highway funding formulas. The number of funding categories has steadily increased since the Interstate Highway Program began to more than 60 today. Formulas for distributing the funds among the states are based on factors first used in 1916 such as rural delivery route mileage, intercity mail route mileage and land area. A 1986 report by the General Accounting Office found these factors unrelated to either the extent or use of the federal-aid highway network. Over $1 billion are now distributed annually under the 85% Minimum Allocation program to correct the acknowledged inequity of the other programs.

However, the most compelling need for new programs and new formulas is the impending completion of the Interstate Highway System. If we are to meet the challenges of the 21st Century, we cannot rely on outdated and narrowly focused programs which were designed to meet the national needs of 35 years ago.

Highway Financing

WHAT ARE THE NEW FORMULAS ?

Two new programs are proposed. A program to support a system of Highways of National Significance would distribute 50% of available funding by the following formula:

- One-ninth for proportional total statewide rural lane miles,
- One-ninth for proportional total statewide rural vehicle miles traveled,
- Two-ninths for proportional total statewide urban lane miles,
- Two-ninths for proportional total statewide urban vehicle miles traveled, and
- Three-ninths for proportional total statewide diesel fuel use.

The methodology used in arriving at these factors is included as Attachment B.

A second program funded by the remaining 50% of available funding would be used to address other nationally significant highway needs. Beyond traditional road and bridge construction and reconstruction, this program would also be directed at urban mobility, suburban congestion, rural access, and modal interlinks, that is, projects which cannot be tied to a specific highway network. These funds would be distributed to each state in proportion to the highway user taxes collected from that state.

Highway Financing

WOULDN'T A NEW FORMULA PENALIZE SOME STATES?

Not at all. The following special protections would ensure that no state is penalized:

- Every state would be guaranteed 1/2% of the funds for the system of Highways of National Significance,
- Every state would be guaranteed 85% of its contributions to the Federal Highway Trust Fund,
- A "hold harmless" provision would guarantee ever state that it receive at least as much in total federal highway funding under the new program as it received in fiscal year 1991,
- Every state, including those on "hold harmless", would enjoy some share of the total federal highway funding growth, and
- For those states with large land areas and a small population, a further supplement could be included.

HOW CAN EVERYONE BE A WINNER?

By spending down the balances in the Highway Trust Fund, funding levels can be raised to nearly $18 billion beginning in fiscal year 1992. That will be sufficient to make the proposed formulas work.

WHO FAVORS THESE CHANGES?

Thus far these concepts have been endorsed by state transportation agencies in Alabama, California, Florida, Idaho, Indiana, North Carolina, Oklahoma, Texas and Wisconsin. The proposal is also compatible with the recommendations of the American Association of State Highway and Transportation Officials (AASHTO), although the formula described above is more specific than AASHTO.

Highway Financing

Attachment A

ACTIVE FEDERAL-AID HIGHWAY PROGRAMS AND FUND DISTRIBUTION METHOD

SYSTEM RELATED PROGRAMS

- Interstate Construction - Based on relative share of cost to complete the system
- Interstate Discretionary - Allocation
- 1/2 Percent Minimum Interstate Apportionment- Guaranteed amount
- Interstate Withdrawal and Substitution - 3/4 apportioned and 1/4 discretionary
- Interstate 4R - 55% I lane miles; 45% I veh.mi.traveled
- Interstate 4R Discretionary - Allocation
- Consolidated Primary - 2/9 area; 2/9 rural population; 2/9 rural delivery route mileage and intercity mail route mileage; 1/3 urban pop. OR 1/2 rural pop.; 1/2 urban pop.
- Urban System - Urban area population
- Rural Secondary - 1/3 area; 1/3 rural population; 1/3 rural delivery route mileage and intercity mail route mileage

Highway Financing

NATIONAL SPECIAL PURPOSE PROGRAMS

- Access Highways to Public Recreation Areas on Certain Lakes - Allocation
- Appalachian Development Highway System - Allocation
- Bicycle Transportation and Pedestrian Walkways - N/A
- Bond Issue Projects - Same as source funds
- Bridge Replacement and Rehabilitation - Relative share of total cost of deficient bridges
- Bridge Replacement and RehabilitationDiscretionary - Allocation
- Bridges on Federal Dams - Allocation
- National Ridesharing Discretionary Program - Allocation
- Carpool and Vanpool - Same as source funds
- Combined Road Plan - Same as source funds
- Commercial Driver's License - Allocation
- Control of Outdoor Advertising - Allocation
- Defense Access Roads - Allocation
- Emergency Relief - Allocation
- Energy Impacted Roads - Same as source funds
- Forest Highways - Allocation
- Indian Reservation Roads - Allocation
- Parkway and Park Roads - Allocation
- Public Lands Highways - Allocation
- "G" Funds - Same as source funds
- Great River Road - Allocation
- Highway Related Safety Grants - Statutory formula
- Highway Safety Research and Development - By FHWA and NHTSA
- Rail-Highway Crossings - Statutory formula

Highway Financing

- Hazard Elimination - Statutory formula
- Junkyard Control - Allocation
- Landscape and Scenic Enhancement - Allocation
- Long-Term Pavement Monitoring - Allocation
- 85% Minimum Allocation - Apportioned
- Motor Carrier Safety Assistance Program - Grants and formula
- National Highway Institute - N/A
- New Community Assistance Grants - Allocation
- Highway Planning and Research - N/A
- Metropolitan Planning - Apportionment
- Planning and Research - N/A
- Research and Development Administrative Funds - Allocation
- Strategic Highway Research - Set aside
- Right-of-Way Revolving Fund - Allocation
- Rural Technical Assistance Program - Allocation
- Sliding Scale Rates - N/A
- Special Urban High Density - Allocation
- Supportive Services - Allocation
- Territorial Highways - Limited to 4 territories
- Toll Facilities Pilot - Same as source funds
- Traffic Operations Program to Increase Capacity and Safety - Statutory formula
- Transportation Systems Management Demonstration - Allocation
- Railroad-Highway Crossings Demonstration - Allocation
- Section 149 Demonstration Projects

Highway Financing

Attachment B

EXPLANATION OF FORMULA FACTORS PROPOSED FOR HIGHWAYS OF NATIONAL SIGNIFICANCE

RURAL AND URBAN LANE MILES

Total statewide urban and rural lane miles within a state is intended to reflect the extensiveness — both in rural and urban areas — of the potential network of Highways of National Significance within the state.

RURAL AND URBAN VEHICLE MILES TRAVELED

Total statewide urban and rural vehicle miles traveled is intended to reflect the intensity of usage of the network of Highways of National Significance within the state.

DIESEL FUEL USE

Diesel fuel use data are consistently collected, relatively accurate, and should be used as an indicator of the intensity of heavy truck travel within the state. In the future, it would be preferable to collect data that precisely measure the number and weight of heavy truck travel in each state.

WEIGHTING OF FACTORS

While there is no scientific guidance in assigning weight to the above factors, assigning each a weight of one-third is reasonable.

Since the estimated costs to preserve and improve the nations highways in urban areas are more than twice the costs in rural areas, it is appropriate to weight urban lane miles and vehicle miles traveled more heavily than rural lane miles and vehicle miles traveled.

The following tables are based upon highway program funding levels near $18 billion in fiscal year 1992, and then gradually increased to $26 billion by fiscal year 1995.

Transportation 2020 Ideas for the 21st Century

FLORIDA DEPARTMENT OF TRANSPORTATION
BOB MARTINEZ
GOVERNOR
605 Suwannee Street, Tallahassee, Florida 32399-0450
BEN G. WATTS
SECRETARY

February 21, 1990

The Honorable Members of the
Florida Congressional Delegation
Washington, D.C.

Dear Delegation Members:

Floridians enjoy the freedom and opportunities afforded by our transportation system. Yet, American transportation now stands at an important crossroads. The Interstate Highway System, which began in 1956, is now essentially complete and the present Surface Transportation Act will expire at the end of fiscal year 1991.

More than just an extension of current highway legislation, the next surface transportation bill may well initiate programs which will have a profound affect upon the State of Florida and this nation for the next 30 to 40 years. If our country's transportation system is to keep pace with the growing needs in states like Florida, changes in the transportation funding and program structure **must** occur.

The accompanying document, "**Transportation 2020: Ideas for the 21st Century...Florida's Future Depends On It,**" is a summary of recommendations that the Florida Department of Transportation would like Congress to consider. These policy suggestions are based upon sound concepts developed by state transportation officials from around the country.

We at the Florida Department of Transportation solicit your support for the recommendations contained in this report, and look forward to actively working with you and your staff to make these proposals a reality.

Sincerely,

Ben Watts

Ben G. Watts, P.E.
Secretary

BGW/dc

Transportation 2020: Ideas for the 21st Century ...Florida's Future Depends On It

At the Crossroads

Floridians, indeed all Americans, love the freedom and opportunities afforded by our transportation system. Transportation touches all of our lives and is essential to this nation's economic well-being. However, as Hurricane Hugo and the California earthquake have graphically demonstrated, when the transportation system upon which we are so unthinkingly dependent is rendered inoperable, modern life grinds to an abrupt halt. All of us need to realize that without transportation ... we just can't make a move.

Without transportation ... we just can't make a move.

Today, American transportation stands at the crossroads. The Interstate Highway System is essentially complete and changes in the current federal-aid program will be necessary if our transportation system is to keep pace with our needs.

To meet these needs, Florida recommends:

Changes in the current program will be necessary to keep pace with our needs.

1.) The current formulas which disperse transportation funds to the states be revised to more accurately and equitably reflect today's needs.

2.) The overall federal transportation partnership be restructured and changes to the existing program be made to more efficiently use whatever level of federal funding is available.

3.) The balance in the Highway Trust Fund be reduced by making increases in the levels of federal transportation funding over a period of years.

Ideas for the 21st Century

Transportation Challenges For Florida and America

Until the early 1970's, Florida's transportation system generally kept pace with needs. Then rapid population growth, changing demographics and new development patterns combined to strain the system. During the past decade, Florida's transportation challenge has grown even more acute. Here's why:

- Florida now has almost 13 million residents and more than 37 million annual visitors.
- In the past decade, automobile registration increased 52 percent, and for every 10 residents Florida now has 12 automobiles.
- Travel on state highways increased 50 percent, but the State Highway System grew only 9 percent in total lane miles.
- Two thirds of Florida's residents now live in urban areas with over 50,000 residents.
- Six of the top 10 growth areas in the nation are in Florida. Most of this growth has occurred in the suburbs, not in central cities.

Florida 's Transportation Challenge.

Ideas for the 21st Century

The national transportation system is a complex, dynamic network of facilities, operations, and management practices. This system of moving people and goods is essential to domestic productivity, international competitiveness, and our quality of life. Transportation accounts for 15 percent of national employment and a substantial portion of the cost of consumer goods. Investments in the transportation system are enormous; it consumes in all its aspects more than $800 billion annually — nearly 20 percent of the gross national product. Our investment in this system must be protected.

Our investment must be protected.

Need for New Federal Legislation

On September 30, 1991, the federal surface transportation program will expire. Over the next several months the Congress will begin deliberating the reauthorization and funding of possibly $90 billion for a 4 to 5-year federal highway and mass transit program. As traffic congestion escalates and highways and bridges continue to wear out, there is considerable debate about the appropriate governmental roles and funding structure for surface transportation programs.

On September 30, 1991, the current program will expire.

The Florida Department of Transportation, like many in the national transportation community, believe that a new national program is needed to preserve and expand the current highway and public transportation system. This new program would put into place the transportation system on which Florida's future growth and the nation's vitality will depend.

Ideas for the 21st Century

The Interstate Highway System

Beginning in 1916, the federal highway role has been to emphasize capital investments, that is, federal money distributed to states and local governments to help them administer capital investments in roads. Since 1956, the cornerstone of federal highway involvement has been construction of the Interstate Highway System.

Cornerstone of federal involvement . . . the Interstate Highway System.

Of the Interstate System's 42,795 miles, 42,291 miles (or 98.8 percent) were open to traffic as of June 1989, according to the Federal Highway Administration (FHWA). In Florida, 1,391 miles of Interstate are now open to traffic and the remaining 66 miles are under contruction.

Now, with construction of the Interstate system approaching an end, the federal role must be reexamined. The need to reauthorize the surface transportation program and the completion of the Interstate system affords an excellent opportunity to rethink the mission of federal surface transportation programs. Clearly, we must choose the next program carefully, for we'll set a course that may well guide us for the next three to four decades as the Interstate program has since 1956.

We must chose the next program carefully... it may guide us for many years.

Ideas for the 21st Century

The Federal Transportation Role For Tomorrow

In designing a future transportation program, we must recognize that issues have changed over time. The transportation issues that Florida and the nation faced in the past are not the same as those it must face today and tomorrow. America, and particularly the State of Florida, are facing tremendous challenges which require reexamination of traditional governmental roles.

Instead of the current practice of spreading federal aid among numerous categorical programs, Florida advocates a redesigned, simplified federal program. In agreement with the recommendation made by the American Association of State Highway and Transportation Officials (AASHTO), of which the Florida Department of Transportation is an active member, we propose a two-part system for both highways and transit in which the present complex system of highway categories would be reduced to two:

A highway System of National Significance — limited in size but powerful in purpose.

1.) A highway System of National Significance (SONS) — limited in size but powerful in purpose — to serve the principal interstate commerce and mobility goals of the nation. Composed of existing Interstates and some principal arterial highways, SONS is intended to be a state designated, federally approved, national system that is expected to focus on a 150,000 to 180,000 highway system. In cooperation with the U.S. Department of Transportation, each state would designate its statewide portion of the SONS based upon criteria that reflect national objectives.

A Flexible Highway Program — aimed at providing a flexible capacity to meet distinctive needs.

2.) A Flexible Highway Program (FLEX) — aimed at providing state and local governments with a flexible capacity to meet their distinctive highway needs — focused on urban mobility, suburban commuting, rural access and modal interlinks. It is designed to

grant funds to the states for rural and urban highway needs beyond the SONS and to state and transit agencies to meet public transportation needs.

Replacing the 60 or so current funding categories with two possessing flexibility for transferring funds between them is a major benefit of the proposed two-part system.

Florida concurs with AASHTO's recommendation that federal funds should be distributed half to the SONS program and half to the FLEX program, after providing for a modest discretionary bridge program, emergency relief, and federal lands roads programs. To further accommodate differing needs among the states, the proposal is that up to 20 percent of a total state allocation may be shifted either way between the SONS and the FLEX programs.

Replacing the 60 or so current funding categories with two is a major benefit.

Transit

Under the new transportation proposal, the basic transit program would remain unchanged. However, the growing balance in the Mass Transit Account of the Highway Trust Fund would be distributed to state and local governments by a new formula providing maximum flexibility to improve personal mobility through the public transportation mode which best meets a community's needs. In addition to traditional bus and rail transit projects, formula funds could be used for high occupancy vehicle (HOV) lanes, traffic signal improvements, system management measures focusing on ride-sharing and transit, and commuter rail capital improvements.

Ideas for the 21st Century

Accountability

The new federal-aid transportation program should assure the Congress that federal funding improves the performance and capacity of the nation's transportation system. Florida recommends that improvements to the system be measured using four principal transportation management plans:

The new program should assure Congress that federal funds will improve the nation's transportation system.

- A pavement management plan,
- A bridge management plan,
- A safety management plan, and
- A congestion management plan.

Each state should prepare and adopt those plans using criteria appropriate to its particular circumstances. The planning process should recognize the need for diversity among the states. The plans should be dynamic, multimodal, and strategic in character; should substitute for other program controls and should be amendable without sanctions. This approach would be an effective and efficient way to assure state accountability to Congress.

Funding Levels

AASHTO recommends that the federal highway program be increased from its current $13 billion level to near $18 billion in fiscal year 1992, and then be gradually increased further to $26 billion by fiscal year 1995. This can be done without new federal revenues until 1994 or 1995 if Congress will invest or "spend down" part of the Highway Trust Fund balance, and repeal the gasohol tax exemptions.

Highway "user" revenues must be preserved for transportation purposes.

The State of Florida has opposed in the past any national gas tax increase to help reduce the federal deficit and continues to do so today. While the federal deficit is an undeniably serious problem, highway "user" revenues must be preserved for transportation purposes.

Ideas for the 21st Century

Although we recognize the benefits of improving federal transportation funding, Florida questions the need for a federal gas tax increase for transportation purposes until the Highway Trust Fund balance is reduced.

Florida questions a federal gas tax increase for transportation until the Trust Fund balance is reduced.

It should be understood that the new transportation proposals contained in this document are essential regardless of program funding levels. The proposed structural changes to the transportation program should not be contingent upon expanded federal funding levels. However, the new program would clearly be more beneficial to the economic well-being of Florida and the nation if current federal funding levels were augmented by yearly reductions in the Highway Trust Fund balance.

The anti-deficit provisions of the Trust Fund, known as the Byrd Amendment, will ensure that spending down of the uncommitted balance of the Highway Trust Fund is a prudent public policy. A 1989 report by the U.S. General Accounting Office (GAO) found that highway commitments could be increased by $7.4 billion without violating the Trust Fund's protection provisions.

Ideas for the 21st Century

The new federal-aid transportation program should encourage creative financing for high-cost capital projects, such as advanced construction funding, toll provisions, and multi-state compacts.

Allocation Formulas

With the advent of new transportation ideas for the 21st Century, the hodge-podge of current federal highway programs will need to be streamlined to meet the challenges of the rapidly approaching new Century. In consolidating the federal programs and reshaping them to respond to new national goals, many of the old formulas which allocate federal funds to the states will become even more obsolete. Some of the present formulas (based on factors such as rural delivery route mileage) are more attuned to the 1920's goal of getting America out of the mud, rather than the 1990's objective of getting us out of a traffic jam.

New formulas for the program must be created.

1920's . . . out of the mud

1990's. . . out of the traffic.

Ideas for the 21st Century

A 1986 report by the GAO evaluated the factors used to distribute federal highway funds. Two of these factors, land area and postal mileage, have been used since 1916 and were found to be unrelated to either the extent of the federal-aid highway network or its use. Nowhere are these factors more outdated than in Florida.

The program should not be based on concepts from the early 1900's without reaffirmation of their validity.

Our transportation systems have undergone dramatic changes since 1916 with the explosion of automobile usage and the changes in the mass transit, railroad and aviation modes. A program for the 1990's and the 21st Century should not be based on the concepts of the early 1900's without a clear reaffirmation of their validity.

Constructing new formulas to distribute federal funds for the new streamlined federal programs is a complex, detailed and controversial process. Because it is, some may wish to dismiss it as a detail to be avoided. However, the allocation formulas are the heart of it all because they decide who gets what.

Allocation formulas are the heart of it all ... they decide who gets what.

SONS Funding

It is Florida's view that funds for the System of National Significance (SONS) should be based upon factors which correlate well with direct national interests. This is vitally important as it would maintain the policy basis for the definition of the SONS. Florida supports AASHTO's recommendation that the SONS allocation formula use total statewide urban and rural vehicle miles of travel (VMT), total statewide urban and rural lane miles, and "other appropriate factors" for the state-by-state distribution of federal funds.

Ideas for the 21st Century

AASHTO did not indicate what these "other appropriate factors" should be. However, with commercial truck travel being a dominant feature behind the economic and interstate commerce goals for the SONS program, Florida believes that factors which indicate the intensity of heavy truck travel should be given significant weight in the SONS allocation formula. Therefore, diesel fuel use, which is a relatively accurate and consistently collected data factor, should be used to indicate commercial truck travel. Florida recommends that diesel fuel be an "other appropriate factor" used in this formula.

As a 'donor' state, Florida wants a better return on our transportation investment.

This formula should be weighted in such a way as to meet new needs, maintain equity, allow flexibility, and avoid sudden disruptions in the current program. In addition, having long been a "donor" state where significantly less than $1.00 is returned for every $1.00 in transportation taxes paid to the Federal government, Florida is vitally interested in ensuring a more reasonable return on our transportation investment. The formula on the following page is carefully crafted to achieve both objectives.

FLORIDA'S RETURN FROM THE HIGHWAY TRUST FUND

Ideas for the 21st Century

Specifically, Florida proposes an allocation system which would distribute:

- Two-ninths of the funds based on total statewide rural lane miles and VMT;
- Four-ninths based on total statewide urban lane miles and VMT;
- Three-ninths based on statewide diesel fuel con sumption to reflect heavy truck travel.

We believe that this allocation system would work well. Florida agrees with AASHTO's recomendation to include a hold harmless provision (with growth) in the allocation system to ensure equity among the states. To further address the concerns of states with large land area and small population, Florida suggests that Congress may wish to consider providing a "low population density" supplement to the SONS allocation.

The FLEX program would return 100 percent of our transportation investment.

FLEX Funding

For the FLEX program, AASHTO recommends and Florida agrees that a donor/donee relationship be avoided. Rather, the FLEX funds would be wholly allocated to each state in proportion to the highway user contributions to the Federal Highway Trust Fund that are attributable to each state. Therefore, under the FLEX program Florida's return of its transportation investment would be 100 percent.

Ideas for the 21st Century

Conclusion

Today Americans enjoy the convenience and economic benefits of a transportation system second to none. This system was made possible largely through a long standing cooperative federal, state, and local government partnership.

The new economic world is vastly more competitive than ever before. A high quality, highly efficient transportation network is needed for a competitive state and nation. Such a network is essential to giving the American people their mobility, and the ability to ship the American materials and products necessary to maintain our quality of life. Good transportation alone is not the only answer; but without it America cannot be competitive.

Our country now has a choice. With some effort and planning, we can successfully guide ourselves into the future. But we must act today to be prepared to meet the new transportation challenge of tomorrow.

Good transportation isn't the only answer ... but we can't be competitive without it.

We must act <u>today</u> to meet the transportation challenge of <u>tomorrow.</u>

ADDITIONS TO THE RECORD

29 SEPTEMBER 1990

Members of the Surface Transportation Subcommittee of
The United States House PUblic Works and Transportation Committee

Dear Committee Members:

OCT 09 1990

I regret that I was unable to attend your recent field hearing held in North Carolina. I trust you are still accepting input from citizens for your deliberations.

Because of the importance of transportation to the quality of life in the entire nation your Committee has an important opportunity to work on programs which can improve life for millions of citizens. No doubt you have received several inputs which suggest that dependence on the automobile can be related to patterns of development in the nation which in many regions have undercut a sense of community. When people live in one community and work in another it is difficult to establish meaningful connections with their neighbors. For example, should they concern themselves with the quality of schools where they live or should they be concerned about schools their prospective workers attend? To be sure the U.S. is a large and complex nation but from your perspective at the national level you have an opportunity to examine what transportation modes have been found to be useful in fostering cohesive communities.

As a citizen of North Carolina I write to urge you to exert some leadership to help our state become less dependent on the automobile. The NC General Assembly recently passed the largest highway construction package in the state's history, $9.2 million for roads. Some of this package can be useful but what North Carolina desperately needs is to develop transportation not dependent on the automobile. For example, in many of our cities and towns young people have practically no mobility because of the dearth of public transportation. This impediment to freedom of movement generates pressure among young people to get a car. Many take a job in order to buy a car. Some leave school to be able to earn enough to make their payments. It might be that the educational levels could be increased if young people didn't "need" a car.

Part of the record NC highway bill is for loops around urban areas. In reality several of these loops are little more than convenience roads to enable drivers to get from one shopping center to another. Perhaps we have reached a time in U.S. history when congestion might be viewed as positive. It might result in people making more conscious choices of whether this trip is really necessary. It might even lead to people walking to a store and possibly even meeting some of their neighbors on route. Imagine what might begin to occur in our communities if folks knew each other once again.

For me a clear symptom of the overreliance on the automobile in North Carolina is that we have "orphan roads" All over the state

one sees signs announcing that this road has been adopted by X person, business or group. This means that the state cannot afford to cover the costs of keeping the right of way clear of litter. We also see considerable evidence of the state's limited ability to maintain highways built with federal funds, such as I40.

In the past 15 years NC has paid in more than it got back from the highway trust fund. I would hope that if you decide to rectify some of this imbalance you will not tie the funds to roads. Instead I urge you to seriously consider helping North Carolina begin to be less dependent on the automobile. With our climate we could be an excellent location for some model programs for developing the bicycle as a viable mode of transportation. (Note: To my knowledge none of the major highways in the NC highway bill have serious provisions for bicycles.)

Most of our cities do not need more convenience roads. We need help to develop transportation which serves the needs of young people, the elderly and those who do not want to be dependent on an automobile. I urge you to use your good offices to develop some creative ideas for state funding that serves to increase citizens' mobility in such a manner that the programs might contribute to an increased sense of community among citizens.

Sincerely,

Freeman T. Clark

Member of Greensboro Visions Transportation Task Force 1982-1983

Statement of
THE HONORABLE PETER H. KOSTMAYER

before the
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION

March 23, 1990

Mr. Chairman, I appreciate the opportunity to testify before you and the other members of the Subcommittee on the reauthorization of our nation's surface transportation programs for the post-1990 period.

I asked to appear before the subcommittee, Mr. Chairman, in order to detail for your members an emerging problem that increasingly threatens transportation in my congressional district and many similar areas around the country. I also want to offer what I believe are some specific solutions to the problems in my district which I think could as easily be applied in other areas.

My district, which consists of Bucks and the eastern portions of Montgomery County, Pennsylvania, is among the fastest growing areas in the nation. Both Bucks and Montgomery counties are accessible to New York as well as Philadelphia business centers and are becoming increasingly popular among workers from both metropolitan areas.

The tidal wave of development we have experienced in recent years now is beginning to endanger the very qualities that have brought so many people and businesses to our area. The issues of overdevelopment, loss of open space and environmental protection now top the list of concerns of the majority of my constituents. The infrastructure of the region, in particular our transportation system, has in many cases become overwhelmed.

As dire as this situation is, it is not unique to my region. Suburban areas across the country, from the Northern Virginia suburbs around Washington to Orange County, California, are experiencing an epidemic of traffic congestion. Automobiles have become the dominant, indeed the exclusive, mode of transportation in areas immediately surrounding cities. In the Philadelphia region, traffic congestion is constraining the very mobility that companies sought by moving into the suburbs.

Unlike historical travel patterns, whereby virtually all travel was radial to and from the center of a major city such as Philadelphia, today's patterns are far more dispersed and suburban oriented.

Two major demographic factors need to be recognized to understand this phenomenon. The population of the region has changed. The City of Philadelphia, long the predominant population center of the region, now represents only 40 percent of the population of the five counties of the southeastern Pennsylvania region. Fully 60 percent of the population now resides in the four suburban counties. Similarly, sixty percent of all work travel in the area is now intra-suburban. Second, while the City of Philadelphia continues to enjoy small incremental growth on a very large employment base, the suburban territory has blossomed into major employment communities totally independent of the City of Philadelphia.

Montgomery County actually imports more labor on a given weekday than there are Montgomery County residents who work in their own county. Montgomery County now has the highest employment in the region outside of Philadelphia, and it is projected to have some 544,800 jobs by 2010, compared to 878,000 in Philadelphia the same year! These new suburban employment centers have helped create major road congestion, due largely to the fact that all transportation in the suburbs was expected to be accommodated via the automobile. What actually has evolved is a constricted highway network crying out for alternate mobility systems in the suburban territory in order to reduce exclusive reliance on the automobile for travel.

Mr. Chairman, nowhere has this problem reached greater dimensions than it has in the U.S. 202 corridor, a portion of which runs from Doylestown, PA in my district to Montgomeryville, PA which lies in Mr. Coughlin's district. The traffic volume on the existing roads between the two communities has swelled to dangerous levels. Long delays in the area are commonplace. Many of my constituents have complained that what used to be a ten-minute trip to the grocery store now takes a half-hour or more. The current Route 202 is a two-lane road, and the lack of shoulders and turning lanes creates an extremely hazardous situation. In addition, congestion in the area clearly adds to air pollution in the surrounding communities. What's more, response time for emergency vehicles has been slowed dangerously.

In the early 1970s, the Pennsylvania Department of Transportation recognized the need for a route to take commuters around the local traffic which burdens the existing artery of U.S. 202. In 1972, PennDOT commissioned engineering drawings for a new U.S. 202 freeway that would carry motorists quickly and safely from central Bucks County to eastern Montgomery County. The need for a freeway was confirmed in a second study conducted by the Delaware Valley Regional Planning Commission in 1984. Unfortunately, the cost of the proposed project, about $160 million, prevented any action on the original plan.

In 1987, with the need for a new roadway growing, PennDOT, along with Bucks and Montgomery counties, commissioned the Delaware

Valley Regional Planning Commission to prepare a second examination of ways to manage traffic in the U.S. 202 corridor.

This study has been released in draft form (I have included a copy for your review) and reiterates many of the agency's earlier findings regarding the need for an improved road system. The study concludes that:

-- "without an increase in capacity in the corridor, traffic will continue to increase to highly congested levels on parallel area highways, including Route 202, Upper State and Lower State Roads."

-- "Traffic is sufficient to justify a new road on new right-of-way. Simulations of future conditions suggest that up to 40,0000 vehicles a day will use the new road."

-- Although it may be possible to build the additional needed capacity into the existing roads, the physical improvements such as widening and the high traffic levels on these roads would change their character to the loss of the community. Furthermore, speeds on these roads would be less than on a new road AND THE SAFETY WOULD ALSO BE INFERIOR." (emphasis added)

Because of the cost associated with a freeway, the new study also recommends the construction of "controlled access arterial roadway," a move that the DVRPC estimates would cut the eventual cost of the project from $160 million to approximately $70 million.

Mr. Chairman, along with traffic relief and safety, a well-constructed arterial roadway could provide increased recreational opportunities and protection for certain historical sites that are part of both Bucks and Montgomery counties. For example, the 300-foot right-of-way envisioned by the DVRPC plan would pass near the General Hancock House in Montgomery Township as well as the Glen Garry Farm in Warrington. The proposed buffer zoning around the road would provide protections against encroaching development for both of these historic properties.

Recreational opportunities that might be created in the right-of-way include trail activities such as jogging and bicycling. Such trails have already been incorporated in portions of the Blue Route highway in Delaware County, Pennsylvania.

A broad right-of-way can also serve as a buffer to current and future development, an advantage to the driver who sees a natural and rural environment and to residents who will be somewhat protected from the noise and activity of the road. The building of an arterial roadway, because it will be designed to meet the needs of the local communities, may not create the development pressure provided by a freeway.

I would also like to point out that time is of the essence in this matter, Mr. Chairman. Several aspects of the Route 202 project are time-sensitive. For instance, Montgomery Township has acquired a significant portion of the right-of-way for the new road under an agreement which would allow the lands to revert to the donor if construction is not begun in the near future. Similarly, the right-of-way proposed in the DVRPC plan remains open and accessible in most areas, a situation that is likely to change as development continues in the area.

Mr. Chairman, for all of these reasons: the time-sensitive nature of the project, the need for increased safety and decreased traffic congestion in the area, the recreational and historic preservation opportunities which the project presents, as well as the potential buffer against runaway development, I believe that the proposed U.S. 202 arterial roadway makes a worthy federal highway demonstration project.

Therefore, Mr. Chairman, I would ask the Committee to authorize $1.6 million to fund necessary environmental studies and right-of-way evaluation in the Doylestown to Montgomeryville corridor.

In addition, Mr. Chairman, while I recognize that it has not been the practice of this committee to authorize demonstration projects that involve railways, I would like to bring to the attention of the members a second possibility that could provide relief to our cross-county transportation problems. I believe my proposal would be worthy of consideration should the committee change its historic practice.

SEPTA, the Southeast Pennsylvania Transportation Authority has recently issued a plan (also enclosed for your review) for the establishment of a new passenger rail line extending from the Downingtown area in Chester County to the Morrisville area in Bucks County just south of Trenton, New Jersey. I would like to briefly outline several points included in the SEPTA study.

Like the Route 202 project, the new rail line would go a great distance toward alleviating the intra-suburban travel problems in my district and could provide a model for other areas around the country.

SEPTA currently captures very little of the cross-county market, since the new travel patterns are lateral and SEPTA's network has been built on historic, radial travel patterns. New employment center development has basically followed the pattern of the express highways which have been built in the region. These employment centers are consecutively spaced about 6 to 10 miles apart and stretch from Morrisville in Bucks County to Downingtown in Chester County, roughly paralleling the Pennsylvania Turnpike and part of U.S. 202.

Happily through an accident of history, a predecessor railroad of SEPTA and Conrail constructed a railroad line initially known as

the "Trenton Cut-Off" and currently referred to by Conrail as the "Morrisville Line." This line extends from Downingtown in Chester County to Morrisville in Bucks County. It was initially constructed through suburban farmlands and relatively unpopulated areas, and was designed to move long distance freight (not destined for Philadelphia) on a route bypassing Philadelphia to avoid coming into the congested part of the city and the then-congested railyards. Again, through an accident of history, the Pennsylvania Turnpike and US 202 were developed as major highways which spawned, in turn, major development and employment centers along them.

Today, in a continuous string of employment centers, one can point to Downingtown, Exton, King of Prussia, Norristown, Plymouth Meeting, Fort Washington, Willow Grove, Southampton, Oxford Valley, and the Morrisville/Trenton areas as major beneficiaries of these past public highway investments. These same employment and development centers also happen to be immediately adjacent to this rail line which now rests comfortably parallel to the Pennsylvania Turnpike and part of US 202 for nearly its entire distance. The railroad alignment was built to high speed standards (80 MPH or more) and is virtually free of grade crossings. As a by-pass rail line, there are also virtually no local freight customers.

The opportunity exists now to utilize this rail line as the first "cross county" passenger rail service, interconnecting these employment centers and providing transfer stations with eight of SEPTA's existing rail services for easy employment access, both from distant suburban locations, as well as from Center City Philadelphia and the parts of the region which lie between the Cross-County line and Center City.

With implementation of this "Cross County Metro" service, SEPTA would be able to create a series of transportation centers throughout the region. With a focus upon this particular cross county service, a series of transit centers would provide easy connections to all parts of the region using rail, bus, van or auto, very similar to the concept now in place at the Norristown Transportation Center and at 69th Street Terminal. These major transportation centers would have large park-and-ride lots for traditional commuters, with easy access from major roadways directly into the parking lot, and standardized, easily recognized signage directing auto users to the park-and-ride facility, perhaps even using electronic signage to convey messages on the next scheduled departing trains. In addition, these terminals would be focal points for a local bus system enabling riders to have quick, easy access from the station to the employment centers in the area and also to nearby residential centers, thereby providing mobility without the use of the automobile. Obviously, these transportation centers would also function as a transfer point for rail-to-rail commuters who might be headed outbound from the city and who are changing trains to the Cross County Metro to get to an employment center.

The concept of the Cross County Metro is new to the Philadelphia area and perhaps even now to the United States. However, it is uncannily similar to the very same concept that has been utilized by highway planners in planning beltways around major cities in the United States to foster suburban travel. The Cross County Metro is really this same concept applied to mass transportation, and it can have a far more beneficial effect on reducing road congestion than any other single investment that the public can make. Compact European cities thrive in spite of severely constrained auto use because they have built a network of radial and peripheral transit lines.

One of the most important factors in presenting a case for a Cross County Metro is to demonstrate that, in fact, it is possible to do and is a good economic investment. Therefore, there are two actions which would be helpful in carrying out the planning for this project:

1) A feasibility study to be conducted which would look at the alignment, the demographics, the potential for ridership and its impact upon development along the corridor; and,

2) Preliminary engineering which would establish the guidelines and specifications for the work to be carried out, the design of the fixed facilities that would be needed to run the operation and establish the cost envelope upon which decisions can be made to further the project or modify the project.

These first two steps, when completed, would provide the basis of information upon which long range investment decisions can be made for public transportation in the region.

According to SEPTA, comprehensive package for the above two elements, plus a preliminary Environmental Impact Analysis, would probably run in the $5 million range. Approximately $1.2 million for the feasibility study, $300,000 for the preliminary EIA, and the remainder for the preliminary engineering.

In conclusion, Mr. Chairman, I would like to mention three additional projects that I believe merit the Committee's consideration:

1. Quakertown Area Park and Ride: $300,000 for the 75 percent federal share of a $400,000 Park and Ride facility at the intersection of Route 663 and the Pennsylvania Turnpike. This would include a traffic signal, intersection improvements and a cone-acre parking area suitable for about 100 cars with possible future expansion. (Milford Township)

2. Bensalem (Woodhaven) Park and Ride: This would be a major (federal share estimated at $7.5 million) Park and Ride facility for about 1500 cars. It would be located at the

Woodhaven exit from I-95 and would include rampway work on the I-95 exit to provide access to the Park and Ride as well as work to provide upgrade intermodal connection with the SEPTA rail line at that point. Amount to be requested: $7.5 million for 75 percent federal share. The importance of this project is related to the major work planned on I-95 during the coming decade.

3. Route 413 Improvements from the Newtown Bypass to Bridgetown Pike: $3.75 million for the federal share of projects relating to the completion of the second phase of work now under way on the Newtown Bypass. The project would involve the upgrading of Route 413 from two lanes for the two miles involved.

Attachment 1

SUMMARY

US 202
MONTGOMERYVILLE TO DOYLESTOWN

DRAFT

March 1989

Delaware Valley Regional Planning Commission

The staff of the Delaware Valley Regional Planning Commission has completed an examination, funded by PennDOT and the counties of Bucks and Montgomery, of ways to decrease traffic congestion in the US 202 Corridor in Montgomery, Warrington and Doylestown Townships. The Commission staff has concluded that an additional roadway on a new right-of-way is essential to adequately carry projected traffic without causing major disruption to current residents. Furthermore, if action is begun soon, it is feasible to build this new road without extraordinary cost, relocation of businesses and residences, and disturbance of natural and historic features. An alignment which, on the basis of a preliminary review, appears to meet both traffic reduction and minimization of adverse impact has been selected.

The Need for the Road

As a part of this study and in a previous study undertaken in 1984, DVRPC has examined the impact of future development on traffic levels in the corridor. These studies have been based upon various assumptions of growth in jobs and residents. They have also made assumptions about what other highway improvements will be built. These differing assumptions have meant that no single set of consistent projections have emerged. Nevertheless, in sum the investigations have prepared DVRPC to state some conclusions:

[1] Without an increase in capacity in the corridor, traffic will continue to increase to highly congested levels on parallel area highways, including Route 202, Upper State and Lower State Roads.

[2] The additional traffic is sufficient to justify a new road on new right-of-way. Simulations of future conditions suggest that up to 40,000 vehicles a day will use the new road.

[3] Although it may be possible to build the additional capacity into the existing roads, the physical improvements such as widening and the high traffic levels on these roads would change their character to the loss of the community. Furthermore, speeds on these roads would be less than on a new road and the safety would also be inferior.

[4] Traffic on these parallel roads may eventually return to today's levels, however, even with a new road, because of increases in housing and jobs in the area. The "through-trip" function of the road will decrease but the "local service" function will increase. Improvements on existing area roadways will continue to be needed after any new road is constructed.

Arterial Roadway Versus Freeway

In the early 1970's, PennDOT commissioned engineering drawings for a new US 202 freeway in this corridor. The need for a freeway was confirmed in DVRPC's 1984 study, although this study assumed continuation of the road at the south end to connect with the US 309 freeway. There are, however, several reasons why this new road might better be planned as a controlled access arterial roadway:

[1] PennDOT has limited resources in the foreseeable future. An arterial roadway will be much less expensive than a freeway and so is more likely to be funded than a freeway.

[2] An arterial road will be more useful for short trips, in that its points of access will be more convenient. In this way, it should offer greater relief for existing roads, and therefore have greater utility to corridor residents.

[3] Similarly, the lower speeds associated with an arterial road will make it a less attractive alternative to drivers who currently use more distant roads. A DVRPC analysis showed that a freeway alternative would draw trips away from parallel roads as far away as Old York Road (PA 263) and Souderton Road (PA 113).

[4] Also, an arterial road, because it will do less to enhance the accessibility to the area, may have less tendancy to induce development than a freeway would. Warrington's stated policy of discouraging development in the northern portion of the township should be easier to carry out.

[5] An arterial roadway can be constructed with limited access so that it can be reached from intersecting roads only and not from driveways adjacent properties. If care is taken in its design and control of access, the new road can offer the driver both speed and safety.

[6] Montgomery Township has acquired a significant portion of the right-of-way for the new road which reverts to the donor if construction is not started in the near future. The ability to offer this significant local contribution makes funding more likely and a less costly and less intrusive design of an arterial roadway can be made ready for construction sooner.

[7] An arterial roadway, with its more frequent entry points is less likely to caused undesirable congestion on access roads. Freeway interchanges, on the other hand, are likely to place very large demands on the intersecting roads.

For these reasons, DVRPC recommends that the road be conceived of as a controlled-access arterial highway. A cross section of a 300' right-of-way is shown in Figure 1. It is recommended that this width, which has been used in the Montgomery Township acquisitions, be maintained as a minimum throughout the length of the road. The reserved alignment should have characteristics which could accommodate a freeway if it is later determined to build the road with grade-separated interchanges.

Figure 1 TYPICAL CROSS SECTION

Alignment

The recommended right-of-way will depart from the present US 202 at a point just south of the intersection with Knapp Road. It will then bisect the property being developed by Unicorp (the "Witchwood Tract") and cross PA 309 (Bethlehem Pike) at a point approximately 1500' south of the intersection of Upper State Road. The alignment then crosses undeveloped land between Bethlehem Pike and Horsham Road in a straight line meeting Horsham Road opposite land which has been previously acquired by Montgomery Township. In this section, the right-of-way passes close to the General Hancock house, an historic site.

North of Horsham Road nearly all of the right-of-way has been acquired by the township, although a portion of the acquired right-of-way adjacent to County Line Road will not be able to be used. The path of the road will need to swing to the east in order to avoid St. John Neumann Cemetery in Warrington Township.

The right-of-way will enter Warrington Township just to the east of the cemetery and will run parallel to Stump Road. Near Detweiler Road, the right-of-way turns northward then crosses Limekiln Pike near the curve just south of Upper State Road. From this point, the road follows the alignment of the 1968 "Orange Route" to a point just south of Bristol Road. At this point, the road begins to curve to the east in order to avoid bisecting the Delaware Valley College's model farm.

The road crosses Almshouse Road just north of Quail Call Drive and passes between the house on the model farm and Glen Garry Farm, a private residence, which are both historic properties. The alignment then crosses Lower State Road about 900' south of the intersection with Wells Road, then Wells Road about 1400' east of the same intersection, curving into the alignment of the built section of US 202 at the interchange with PA 611.

Under the assumption of an arterial road, intersections would occur at the following cross roads, from south to north:

- (Extension of) Knapp Road
- Internal circulation road on the "Witchwood Tract"
- PA 309 (Bethlehem Pike)
- Internal circulation road on the "General Hancock Farm"
- PA 463 (Horsham Road)
- County Line Road
- Limekiln Pike
- Pickertown Road
- Bristol Road
- Almshouse Road
- Lower State Road
- Wells Road

Future analysis may indicate the need for grade separation or interchanges at one or more of the crossroads listed above. No conclusions have been made regarding the location of interchanges if the road were to be built as a freeway. Figure 2 indicates the location of the alignment. The right-of-way is also shown on aerial photographs available for inspection at DVRPC.

The significant reduction in cost to the state attributable to the acquisition of land by Montgomery Township has been already mentioned. In other portions of the assumed right-of-way in Montgomery, large land parcels which are likely to be developed in the near term offer additional opportunities to contribute land and even completed roadways to the project.

This alignment requires that several small streams and adjacent wetlands and wet soils be crossed. Although small areas of prime agricultural land and wooded parcels would need to be taken, no large areas of such lands would be bisected. The crossing of Neshaminy Creek represents the single most important environmental issue in designing this road.

Several historic sites in Montgomery and Doylestown townships lie close to the proposed right-of-way. Again, sensitive design can use this situation to advantage, allowing the buildings to be seen without adversely affecting the use of the site.

Opportunities

The construction of a new road on new right-of-way offers a number of opportunities for the townships affected to shape the character of the corridor. Adoption of a special overlay zoning district in the corridor of the highway can assure that aspects of local master plans are implemented and that safety and esthetic qualities are included in the design of adjacent developments.

The 200' right-of-way can provide ample land to accomplish other objectives, such as additional recreational facilities. Trail activities, such as jogging and bicycling are now popular and appear to be enduring. Acquisition of a new right-of-way presents an opportunity to build trails which can benefit residents. Trails have been incorporated into portions of the Blue Route in Delaware County.

A broad right-of-way can also serve as a buffer to current and future development, an advantage to the driver who sees a natural and rural environment and to residents who will be somewhat protected from the noise and activity of the road.

Aesthetic elements can be introduced to make the experience of travelling this road unique and serving to leave a favorable impression of the municipalities through which it passes. (For example, in Indian Wells California, the proposed reconstruction of Route 111, a 50-mile per hour arterial road, will include in sequence: a gate formed by a grove of native date palms, an open area in which community buildings are clustered, a vista of an oasis fountain, and a gate to an historic site. The visitor may also remember the road segment by the formal planting which line one side of the road contrasted with informal plantings on the other. Indian Wells intends to use the road as a means of identifying its character and controlling adjacent development. An annual assessment of all properties within a mile-wide corridor pays for the plantings and their maintenance.)

The alignment includes a number of horizontal and vertical curves which can provide a stimulating driving experience. Of particular interest is the descent from the road's high point at its crossing of Limekiln Pike to the bridge over the Neshaminy Creek. The alignment provides a vista of Doylestown in the distance as well as the nearer Neshaminy ravine.

The point of this discussion is that local residents needn't view the construction of a new road as an intrusion controlled by outside interests. The road can be made useful to its neighbors and can be a tool in promoting local plans.

Officials in each of the municipalities most affected by the construction of the "Bypass" could form an advisory committee immediately, perhaps under the auspices of the county planning commissions, to assure that local planning objectives are considered in the design of the road. This same body may coordinate other transportation planning in the region, particularly on shared roads such as Upper State and County Line.

Environmental Impact Statement

Throughout this planning study, the likely impacts of the new road have been considered. DVRPC has sought to minimize adverse impacts. This exercise will not eliminate, however, the necessity of conducting a thorough environmental impact statement (EIS), complete with an analysis of alternatives, including the options of not building the road or building it in some alternative alignment. Presumably, the care taken in this study will enhance the likelihood that the EIS will also conclude that there is a feasible alignment for the roadway. It is therefore important that an EIS be conducted soon so that acquisition of the right-of-way can

be completed. Before the EIS can begin, however, DVRPC must include the highway for engineering on its Transportation Improvement Program and PennDOT must include the project for engineering in its Twelve Year Plan.

Action to achieve these programming steps will begin with the submission of testimony to the State Transportation Committee at its regional hearing on March 23rd. In part, DVRPC's testimony will read:

> *Recommended for early construction is an eight-mile section on new right-of-way between Montgomeryville and Doylestown. All townships in the path of the road have agreed on a desirable alignment and will act to preserve it. Advancement of this project is urgent, as one township's contract with developers calls for the land to revert to the donors if formal, definitive action to build the road is not taken in the next three years. The first step is to fund a preliminary design/environmental impact statement.*

Attachment 2

THE CROSS COUNTY METRO

SEPTA has recently discussed the possibility of establishing a new passenger rail line extending from the Downingtown area in Chester County to the Morrisville area in Bucks County just south of Trenton, New Jersey. The thrust behind the development of this concept is two-fold:

First, traffic congestion in the suburban areas of the Philadelphia region is approaching a level which will begin to constrict economic growth and development; and,

Secondly, there is an available, existing railroad right-of-way roughly parallel to the Pennsylvania Turnpike and part of US 202 and penetrating virtually every major employment center in the suburban Philadelphia region which intersects with most of SEPTA's radial rail services.

In the region, there are three major types of travel patterns. The first travel pattern is referred to as the "traditional commute." The traditional commute generally involves a work trip made from a suburban location to Center City Philadelphia, or from an outlying part of the city to Center City. The traditional commute market is strong and growing incrementally, and SEPTA captures a substantial portion of that market. The continuation of SEPTA's ability to attract that market is solely a funding-related matter. More major park-and-ride stations are needed, more parking spaces at existing stations are needed, more bus feeder connections are needed (similar to the inter-modal terminal recently constructed in Norristown), more rail cars and locomotives are needed, and a

greater frequency of service must be operated. These are the elements which will ensure SEPTA's historical and predominant role in the traditional commute market.

The second travel pattern, which is of more recent emergence, is that of the reverse commuter. With the job development in the suburbs, there has been an increased need to import labor, especially in the unskilled, semi-skilled, entry-level and clerical areas to support the growth and development of these companies. Much of the potential employment market resides in the City of Philadelphia and this labor pool is highly transit reliant. In the past several years, SEPTA can identify the "reverse commute" market as the fastest growing segment of our marketplace. In the morning rush hour, at least eight major bus routes and one suburban rail transit operation now carry more people outbound than they carry inbound. Additionally, fully 10% of all the peak hour riders on the regional rail system are headed in the opposite direction of the traditional commuter. SEPTA has the ability, with some fairly modest connecting services, to capture a substantial portion of this growing market.

Lastly, there is the matter of the cross county commute. Fully 60% of all work trip travel is now intra-suburban. SEPTA captures very little of this market, since the travel patterns are lateral and SEPTA's network has been built on historic, radial travel patterns. New employment center development has basically followed the pattern of the express highways which have been built in the region. These employment centers are consecutively spaced about

6-10 miles apart and stretch from Morrisville in Bucks County to Downingtown in Chester County, roughly paralleling the Pennsylvania Turnpike and part of US 202.

Today's Travel Patterns

Unlike the historical travel patterns of the past, whereby virtually all travel was radial to and from the center of a major city such as Philadelphia, today's patterns are far more dispersed and suburban oriented. Two major demographic factors need to be recognized to understand this phenomenon:

1) The population of the region has changed. The City of Philadelphia, long the predominant population center of the region, now represents only 40% of the population of the five counties constituting the southeastern Pennsylvania region. Fully 60% of the population now resides in the four suburban counties.

2) While the City of Philadelphia continues to enjoy small incremental growth on a very large employment base, the suburban territory has blossomed into major employment communities totally independent of the City of Philadelphia. Montgomery County actually imports more labor on a given weekday than there are Montgomery County residents who work in their own county. Montgomery County now has the highest employment in the region outside of Philadelphia, and it is projected to have some 544,800 jobs by 2010, compared to 878,000 in Philadelphia the same year. These new suburban employment centers have helped create

major road congestion, due largely to the fact that all transportation in the suburbs was expected to be accommodated via the automobile. What actually has evolved is a constricted highway network crying out for alternate mobility systems in the suburban territory in order to reduce exclusive reliance on the automobile for travel. Suburban congestion has emerged as a national problem. In the case of the Philadelphia region, it is constraining the very mobility that companies sought when they went to the suburbs to establish their businesses in the first place. It was never envisioned that the automobile would ever be so predominant, and become virtually the exclusive mode of transportation in the suburbs. This suburban gridlock is beginning to have a deleterious effect on the ability of the Philadelphia region to continue its strong economic growth, and, in fact, has already begun to constrain corporate expansion in many parts of the region. The expansion problems businesses in our region are experiencing are basically related to job accessibility--or rather the lack of it.

Why the Job Shift?

It has been discussed that Center City Philadelphia is continuing an expansion of its already extensive employment base on a steady, incremental basis. However, while the City of Philadelphia continues to experience job growth, the type of job that is coming with the new Center City development is vastly different from the jobs which have been displaced in years past. The high cost of construction in Center City has limited the rental market to the growing demand for space to house the highest level executive,

managerial and professional service employee due to the high rental cost of the office space itself. While there are support jobs required for this high level managerial business group, they also tend to be skilled, professional, secretarial and clerical jobs. Other support based services, i.e. food industry, and to a lesser extent retail, also exist, but not nearly to the extent as in years past. The jobs that have gone to the suburban territory have likely gone there due to economics. Land is less expensive (or was), building costs lower, and the potential employment market plentiful. Now the suburban employers are finding that the very people they need the most, the unskilled, semi-skilled and clerical worker, are the least available. Furthermore, the candidates for these jobs do not have the ability to get to the job site in an expeditious manner that would permit employment at these remote locations to be economically viable. In short, no direct public transportation.

What we have is, to a large extent, a mismatch between residential areas and employment locations. The people who live the farthest away from the city tend to be the people who are occupying the new office spaces in Center City Philadelphia, and Philadelphia residents are primarily the candidates for many of the jobs that are going unfilled in the suburban territory.

From SEPTA's perspective, this "mismatch" is an ideal transportation opportunity. SEPTA can satisfy two markets. It can capture an inbound market in the morning, bringing suburban people from the outlying points to the City, and at the same time, fill

seats on trains which are going outbound in the morning to bring city residents to the job centers in the suburbs, and then refill the trains again with people coming to work in the city. This has the potential to make the regional railroad network a far more cost-effective operation than it has ever been in the past.

The First Step To Help Suburban Mobility With Transit

Solely through an accident of history, a predecessor railroad of SEPTA and Conrail constructed a railroad line initially known as the "Trenton Cut-Off" and currently referred to by Conrail as the "Morrisville Line." This line extends from Downingtown in Chester County to Morrisville in Bucks County. It was initially constructed through suburban farmlands and relatively unpopulated areas, and was designed to move long distance freight (not destined for Philadelphia) on a route bypassing Philadelphia to avoid coming into the congested part of the city and the then-congested railyards. Again, through an accident of history, the Pennsylvania Turnpike and US 202 were developed as major highways which spawned, in turn, major development and employment centers along them. Today, in a continuous string of employment centers, one can point to Downingtown, Exton, King of Prussia, Norristown, Plymouth Meeting, Fort Washington, Willow Grove, Southampton, Oxford Valley, and the Morrisville/Trenton areas as major beneficiaries of these past public highway investments. These same employment and development centers also happen to be immediately adjacent to this rail line which now rests comfortably parallel to the Pennsylvania Turnpike and part of US 202 for nearly its entire distance. The

railroad alignment was built to high speed standards (80 MPH or more) and is virtually free of grade crossings. As a by-pass rail line, there are also virtually no local freight customers.

The opportunity exists now to utilize this rail line as the first "cross county" passenger rail service, interconnecting these employment centers and providing transfer stations with eight of SEPTA's existing rail services for easy employment access, both from distant suburban locations, as well as from Center City Philadelphia and the parts of the region which lie between the Cross-County line and Center City.

Multi-Modal Transportation Centers

With implementation of this "Cross County Metro" service, SEPTA would be able to create a series of transportation centers throughout the region. With a focus upon this particular cross county service, a series of transit centers would provide easy connections to all parts of the region using rail, bus, van or auto, very similar to the concept now in place at the Norristown Transportation Center and at 69th Street Terminal. These major transportation centers would have large park-and-ride lots for traditional commuters, with easy access from major roadways directly into the parking lot, and standardized, easily recognized signage directing auto users to the park-and-ride facility, perhaps even using electronic signage to convey messages on the next scheduled departing trains. In addition, these terminals would be focal points for a local bus system enabling riders to have quick,

easy access from the station to the employment centers in the area and also to nearby residential centers, thereby providing mobility without the use of the automobile. Obviously, these transportation centers would also function as a transfer point for rail-to-rail commuters who might be headed outbound from the city and who are changing trains to the Cross County Metro to get to an employment center.

The concept of the Cross County Metro is new to the Philadelphia area and perhaps even now to the United States. However, it is uncannily similar to the very same concept that has been utilized by highway planners in planning beltways around major cities in the United States to foster suburban travel. The Cross County Metro is really this same concept applied to mass transportation, and it can have a far more beneficial effect on reducing road congestion than any other single investment that the public can make. Compact European cities thrive in spite of severely constrained auto use because they have built a network of radial <u>and</u> peripheral transit lines.

<u>What Type of Service Would SEPTA Operate?</u>

SEPTA envisions utilizing a high-speed, electrically propelled rail car, similar to the new cars which are soon to be delivered for use on SEPTA's Route 100 service between Norristown and 69th Street Terminal. In fact, the cars which SEPTA will receive have been designed to operate either from a third rail or from an overhead wire. The right-of-way on the Cross County Metro already has

structures in place which would hold up an overhead wire for powering the rail cars to run along the line. It is not envisioned that freight service and passenger service would intermix on the same tracks; however, these services certainly are capable of utilizing the same right-of-way for parallel operation, as has been done in many other cities in the United States and overseas. Utilizing the transit vehicle similar to the Route 100 cars offers SEPTA tremendous flexibility, especially with regard to efficient operation, frequency of service, and incorporation of maintenance into other investments already made in the SEPTA system. A track connection can be made in the vicinity of Hughes Park in Upper Merion Township between the existing Route 100 line and the Cross County Metro tracks.

Conrail has already determined that a major portion of this line is going to be "downsized" resulting in removal of at least one track between Norristown and Downingtown, making that right-of-way available for SEPTA should funding become available, and the determination be made that this is the proper place to make a capital investment. The alignment of the Cross County Metro is a high speed, fully grade separated, railroad with many of the employment centers being within walking distance of potential station sites. The potential also exists for SEPTA and the private sector to construct major new developments along the right-of-way, concentrating employment, providing a passenger base, and requiring far less utilization of land for parking than is currently the case in the suburban territory. The proportion of land utilized for parking in the suburban territory is one of the major causes of

sprawl and also the major cause of the congestion on the roads. This, in turn, results in some of the adverse environmental conditions experienced in the Philadelphia area.

What's Needed Next?

One of the most important factors in presenting a case for a Cross County Metro is to demonstrate that, in fact, it is possible to do and is a good economic investment. Therefore, there are two actions which would be helpful in carrying out the planning for this project:

1) A feasibility study to be conducted which would look at the alignment, the demographics, the potential for ridership and its impact upon development along the corridor; and,

2) Preliminary engineering which would establish the guidelines and specifications for the work to be carried out, the design of the fixed facilities that would be needed to run the operation and establish the cost envelope upon which decisions can be made to further the project or modify the project.

These first two steps, when completed, would provide the basis of information upon which long range investment decisions can be made for public transportation in the region.

"Guesstimate" of Costs for

Feasibility and Preliminary Engineering

A comprehensive package for the above two elements, plus a preliminary Environmental Impact Analysis, would probably run in the $5 million range. Approximately $1.2 million for the feasibility study, $300,000 for the preliminary EIA, and the remainder for the preliminary engineering.

AND TRANSPORTATION

HEARINGS ON
FEDERAL AID HIGHWAY REAUTHORIZATIONS

STATEMENT OF THE
REGULAR COMMON CARRIER CONFERENCE

I. INTRODUCTION

The Regular Common Carrier conference (RCCC) appreciates this opportunity to comment on legislation to reauthorize our Nation's highway program which is of paramount importance to the trucking industry. The RCCC is a national trade association composed of approximately 350 for-hire motor carriers with a combined annual revenue of $15 billion. They transport general commodities in less-than-truckload (LTL) shipments throughout the United States. As common carriers, they form the backbone of the Nation's for-hire transportation network providing service to all shippers and communities.

The RCCC is affiliated with the American Trucking Associations, Inc. and endorses its statement and testimony before this Subcommittee. We wish, however, to emphasize in our statement those highway, productivity, safety, and regulatory

issues of particular importance to the LTL general freight trucking industry.

II. THE FEDERAL ROLE IN THE HIGHWAY PROGRAM

There can be little dispute that the federal government's initiative in 1956 to construct and fund a system of Interstate and primary highways throughout the United States has significantly enhanced our Nation's economic growth, productivity, and mobility. The federal government's investment in our highway infrastructure has substantially benefited our Nation. The federal government must continue to play a significant federal role in future highway programs if we, as a Nation, are to maintain our competitiveness. While there should be serious consideration of increasing the states' role in highway program development and affording them more flexibility in meeting their particular transportation and economic needs, the RCCC submits that the federal government must take the leadership role in the following areas.

A. Highways of National Significance

Nationwide, there are more than 3.8 million miles of public highways and streets. Approximately 850,000 miles are constructed and maintained primarily with federal funding. These "Federal Aid Highways" have three components. There is the Primary system, which consists of 44,000 miles of Interstate

38-253 O—91——109

highways and 258,000 miles of arterial highways that connect cities and centers of economic activity. The Secondary system, composed of 298,000 miles of rural major connector roads, links farms and smaller communities with the Primary system. Finally, the Urban system is comprised of 148,000 miles of high volume traffic roads in urban areas. This Federal Aid System has about 20 percent of the highway mileage, but carries 80 percent of all traffic.

It is imperative that the federal government preserve, expand, and reconstruct our system of Interstate and Defense highways, as well as the major Primary highways essential to develop a national network connecting our population centers. This national system of significant highways should comprise approximately 140,000 to 160,000 miles of highways. Although it is only about one-fifth of the current federal-aid highway system, these Interstates and Primary highways handle approximately 70 percent of all commercial freight transportation.

To meet this objective, full federal aid funding, as now authorized, should be provided through fiscal year 1991. After the completion of the Interstate System, these Highways of National Significance must become the principal federal aid system. This system should receive the highest federal aid matching ratio and funds necessary to maintain it and upgrade those roads that do not meet Interstate standards.

B. Continued, But Lesser, Federal Funding For Bridges, Secondary and Urban Roads

Federal aid should continue for major bridges and for secondary and urban roads off the national system to ensure mobility and efficiency. While the level of funding must remain significant, it should be less than the federal aid ratio for the Highways of National Significance. The states can assume a greater financial responsibility in this area.

C. Pavement Design, Construction, and Maintenance

The federal government should develop a long term plan or strategy for increasing the useful life spans of our highways through improved pavement designs, construction, and maintenance. Some of our highways are deteriorating prematurely because greater emphasis is placed on minimizing initial construction costs rather than overall costs. This short term thinking is penny wise and pound foolish since resulting maintenance and rehabilitation expenses significantly increase the costs over the useful life of a road.

The economies of building roads with thicker pavements and drainage are well documented and understood by highway engineers. According to the American Association of State Highway and Transportation Officials (AASHTO), one additional inch of concrete pavement effectively doubles the strength and life of a pavement, yet adds only four (4) percent to pavement related

construction costs and less than one-half(½) of one (1) percent to the total construction costs of a rural Interstate highway, according to Federal Highway Administration (FHWA) cost data. The incremental cost increase is far outweighed by the substantial future savings.

Rural interstate concrete highways are typically constructed ten inches thick. If they were made 14 inches thick, they would be eight times more durable, according to AASHTO. This increased thickness would increase pavement construction costs by only fifteen (15) percent and total costs by less than two (2) percent. Consequently, the RCCC recommends that pavements on main line truck routes be built at least 14 inches thick. In particular, we recommend upgrading of those lanes ordinarily traveled on by trucks, i.e., the right lane and center lane (where applicable).

In addition, there is a need for increased federal oversight of construction projects to ensure that the contractors are complying with existing contract specifications and standards. More federal inspectors, adequately trained, will enhance road project development and ensure that the federal government is receiving the quality work it has paid for.

D. Federal Highway Funding

RCCC recommends that the current federal expenditures of $12.5 billion be increased to $17.5 billion annually. This

increased spending can be supported over four years, until 1995, by drawing down the $11 billion surplus in the Highway Trust Fund. The expenditure of Trust Fund monies is essential if the states are to maintain and improve our national system of highways.

The federal trust fund must be made permanent to ensure a reliable and adequate revenue source for our Nation's infrastructure. Diversion of trust fund monies for deficit reduction should not be allowed; it will undermine the infrastructure and unfairly place the general burden of deficit reduction on highway users.

In a similar vein, the exemption of gasohol from the federal motor fuel taxes should be eliminated. Since 1979, that exemption has cost the Highway Trust Fund more than $3 billion, at a time when federal spending on highways has been inadequate to meet our needs.

The federal expenditure of $17.5 million annually, financed through use of existing trust fund surplus monies, should be adequate to meet our infrastructure needs until 1995. No new federal taxes on fuel, tires, truck sales, or heavy vehicle use should be considered until all trust fund monies have been spent. The trucking industry has and continues to be willing to pay its fair share to maintain and improve our highways. Commercial trucks now contribute over 42 percent of the revenue in the federal Highway Trust Fund. Congress can assess the need for

additional truck taxes after the trust fund surplus has been spent.

A federal weight distance tax on trucks should not be allowed. They are costly to administer, subject to evasion and inequitable, particularly when based on gross vehicle weight since they unfairly impose excessive cost burden responsibility on heavy trucks. The federal government already has a taxation method that efficiently and fairly takes vehicle weight and distance into account; the heavy vehicle use tax and fuel tax both factor in weight and distance.

E. Research and Development

The federal government must lead the effort to promote innovation, new technologies, improved equipment and superior infrastructure designs and construction through greater funding of research and development. Federal transportation research and development expenditures, in constant dollars, have declined over 40 percent from 1980 to 1987, according to the National Governors Association's Task Force on Transportation Infrastructure.

The level of federal expenditures on highway R&D is woefully inadequate. For example, the federal government will probably spend in FY 1991 less than $10 million for highway R&D projects related to safety, congestion, and equipment, even though the federal R&D budget is $71 billion, of which DOT's share is $422 million. More is spent on the railroad industry than trucking

industry, notwithstanding that 77 percent of the Nation's freight expenditures are for trucking services.

Increasing federal R&D on highway pavements and designs, truck equipment, cleaner fuels, and safety will have significant paybacks through improved productivity and safety and reduced congestion and pollution. Consequently, the RCCC recommends that beginning with FY 1992, the federal government earmark $50 million annually for DOT research and development on truck related matters.

III. EQUIPMENT PRODUCTIVITY

The trucking industry must be able to operate more productive, fuel efficient equipment to meet the needs of manufacturers and retailers throughout the Nation. In the Surface Transportation Assistance Act of 1982, Congress authorized the use of 48 foot semitrailers and twin 28 foot trailers on our Interstates and mandated reasonable access to terminals and other facilities.

Since 1982, the LTL trucking industry has made substantial purchases of and fleet conversion to twin 28 foot trailers. These trailers reduce our linehaul costs by about 16 to 19 percent and our terminal costs by another 10 percent through reduced handling when compared to the 45 foot trailers they replaced. The Transportation Research Board (TRB) estimates that twin 28s will, by 1990, have the effect of reducing annual

vehicle miles traveled by 493 million with a corresponding savings of fuel, reduced congestion, and labor expenses. This translates into an annual savings of about $400 million -- a significant benefit to our Nation's transportation consumers. As a result of our conversion to twin trailers, the LTL trucking industry has achieved significant although stunted productivity gains. Moreover, TRB found, and operational data confirm, that there is no adverse safety impact in using twin 28s when compared to single 45s.

To maximize these gains, there must be federal guidelines to ensure reasonable access to and from the federal highway system to our terminals and customers. The federal government needs to adopt rules to ensure that the state and local governments provide such access and that any state restrictions be based on legitimate, proven safety problems associated with these vehicles on particular roads. The RCCC anticipates that DOT will promulgate access rules this Spring. However, if such rules are not forthcoming or are unduly restrictive, Congressional action will be necessary to achieve the productivity gains originally intended.

There are additional equipment and productivity measures that Congress should undertake. First, to protect against any backsliding for STAA authorized vehicles, Congress should explicitly provide that these vehicles are allowed to operate on the Highways of National Significance which will embrace our future national highway network.

Second, the "grandfather provisions" under existing law, which authorize the states to allow vehicles weighing in excess of 80,000 pounds to operate on the Interstates, must be preserved. Currently, 17 states allow so-called longer combination vehicles (LCV) to operate on the highways under a special permit process which typically imposes special requirements on the drivers, equipment, and roads. The attached article by the Western Highway Institute demonstrates clearly that LCVs have an exemplary safety record based on documented travel. Moreover, the productivity benefits to our industry and the Nation are significant. A national LCV network, administered by the states, could result in annual savings of $4.4 billion to the economy, according to a report conducted by Sydec, Inc. for ATA.

Such vehicles provide additional benefits. These vehicles consume less fuel on a per ton-mile basis than other trucks. Consequently, they will help conserve our domestic oil supplies and minimize our growing dependence on foreign oil. They also will assist our Nation's clean air program. These LCVs produce less pollutants since they consume less fuel on a ton-mile basis. Additionally, they will help somewhat in reducing highway congestion since fewer trucks will be required to transport the same amount of freight. Importantly, LCVs provide one means for the trucking industry to address the mounting shortage of qualified truck drivers, particularly in the truckload segment.

The Transportation Research Board currently is preparing a report on the federal truck weight regulations. That TRB truck weight study will recommend to Congress that the states be allowed to permit higher gross weight limits for commercial trucks based on their significant productivity benefits which outweigh the incremental pavement and bridge costs. The RCCC urges Congress to seriously consider the TRB recommendations.

IV. SAFETY

Safety on our highways must continue to be a top objective for the federal government and private industry. The Motor Carrier Safety Assistance Program (MCSAP) has improved enforcement of our safety laws. The current federal funding of $60 million annually should be continued. There is room for improvement in the MCSAP program. There needs to be greater training of commercial vehicle inspectors. Currently, there is a wide divergence in the level of training and consequently knowledge of equipment and safety laws. The federal government should establish a training program.

Other modifications should be made to MCSAP, particularly to require a reinspection of vehicles found deficient. Also, a system needs to be devised to eliminate repeated inspections by the states of safe vehicles operating in interstate commerce. Today, a vehicle might be subject to several inspections on a single trip. There should be a mechanism which allows an

inspection by one state to be accepted or honored by another during a given time period.

The RCCC also supports a return to the 55 mph speed limit. Simply put, the record demonstrates that 55 mph saves lives and fuel.

The LTL trucking industry also supports drug testing of interstate and intrastate drivers prior to employment, at each DOT biennial physical, upon reasonable suspicion, and after an accident. We also support mandatory random testing by the government at roadside inspections, but not by the employer, largely because it is extremely costly, likely to promote litigation, and since employer testing will not reach the substantial population of independent truck drivers and small truck operators

Mandatory alcohol testing, as proposed in one Senate bill, is at best premature, and at worst, a costly proposal that will produce minimal benefit. Enhanced state enforcement of the current federal and state alcohol abuse prevention rules will achieve much greater results.

V. DEREGULATION OF INTERSTATE TRUCKING AND PREEMPTION OF STATE REGULATION

At a March 28th hearing before the House Government Operations Subcommittee on Commerce, Consumer, and Monetary Affairs, the Department of Transportation (DOT) testified in support of deregulation of interstate trucking and federal

preemption of state economic regulation. DOT endorsed H.R. 4261, a bill that generally preempts or limits state laws and regulations affecting interstate trucking companies. DOT indicated during this hearing that its highway reauthorization proposal will embrace these deregulation initiatives, as outlined in its National Transportation Policy.

Consequently, the RCCC wishes to express its emphatic opposition to further deregulation and preemption of state economic regulation.

There are two major premises underpinning these deregulation proposals. The first major premise is that interstate transportation productivity, efficiency, and safety have improved since the Motor Carrier act of 1980 and administrative deregulation by the ICC. However, the facts discussed below demonstrate otherwise. The second premise is that the states are not capable of determining what, if any, regulation of intrastate trucking is in the public interest. The deregulationists conclude that no state economic regulation is warranted. They are wrong.

A. Federal Deregulation Has Not Enhanced Transportation Efficiency, Productivity, or Safety

In 1980, Congress relaxed interstate trucking regulation. The former policy of restricted entry into trucking was virtually eliminated with the fitness and safety of new companies becoming

the only qualifiers. Rate regulation was retained; yet, constraints were placed on the motor carriers' collective ratemaking actions. The Motor Carrier Act of 1980 was a product of compromise -- it was neither total deregulation nor a continuation of past stringent regulation. It retained the fundamental goals of promoting reasonable, nondiscriminatory rates, quality service, and safety while introducing more competition and streamlining the administrative process. However, over time, the ICC, dominated by a deregulatory majority, has largely sapped the remaining regulation of its strengths.

Consequently, we have nearly a decade of experience to compare the relative strengths and weaknesses of the trucking industry under essentially free market forces with the past regulatory program.

A financially sound trucking industry is an integral ingredient to transportation productivity, efficiency, and safety. Trucking companies need an adequate return on investment and profits to purchase more productive and more safe equipment and to hire and retain qualified drivers and mechanics. Over the past decade, the trucking industry has suffered from inadequate returns and profits. This has adversely impacted all aspects of trucking.

Historically, the ICC has held that trucking companies need a 93 operating ratio, which is a comparison of expenses to revenue, to maintain profitability. An operating ratio of 93

allows the carriers an adequate seven percent margin to pay federal, state, and local taxes, interest on loans, and purchase new equipment. Since 1980, the LTL trucking industry has never achieved this goal of a 93 operating ratio. During this period, the ratio has been, on average, 96.5. An operating ratio of 97 indicates nonprofitability and a candidate for failure.

In 1989, the poor financial condition for the LTL general freight carriers took another turn for the worse. The operating results of the fourth quarter of 1989 were the worst of the decade, including both recession years 1981 and 1982.[1/] There were no operating profits in the last quarter of 1989. Indeed, more than half of the LTL carriers for which data are available suffered operating losses in the fourth quarter of 1989. Preliminary evidence on the first quarter of 1990 suggests that the widespread pattern of losses continues unabated. Such profit deterioration is not confined to particular sizes of carriers. Nor is it related to whether carriers are publicly-owned or privately-owned or to whether or not they are unionized.

Labor productivity has declined since 1980. The industry is not generating sufficient returns to provide the higher wages and better working conditions to attract and maintain qualified drivers. We are now facing severe driver turnover rates and a growing labor shortage. The trucking industry experiences

---

1/ The financial data are tabulated from carrier Quarterly Reports to this Commission, and reflect data for carriers required to be included by the major rate bureaus in their MC-82 filings.

industry driver turnover rates of 20-25 percent. Some companies, including more profitable and established ones, have turnover rates of 100 percent or more. Productivity and safety suffer from this shortage and turnover rate.

There has been a disinvestment or insufficient investment in equipment which, like labor, is a critical component in our productivity and safety. In 1980, the LTL industry had 391,665 tractors and trailers. By 1988, it decreased to 362,606 pieces of equipment. Some carriers must forego purchasing the more fuel efficient, larger vehicles that enhance productivity and efficiency.

Equipment is aging since carrier net income is not adequate to allow the routine replenishment of equipment. Yet money spent for equipment maintenance by LTL carriers is decreasing. In 1980, LTL carriers spent $999 million on maintenance. In 1988, $652 million was spent on equipment upkeep. Normal maintenance is being postponed.

The trucking industry, in general, is having a difficult time attracting public and private investors because of the inadequate operating ratios and returns on equity under deregulation. Why would investors put their money in an industry whose net income, before interest and taxes, is under three percent when risk free investments generate greater returns? The trucking industry must largely finance its equipment purchases internally or postpone them. Productivity growth is being sacrificed.

The trucking industry is committed to transportation safety. However, the reality is that safety costs dollars: it requires the hiring of qualified drivers and mechanics; the proper maintenance and replenishment of equipment; and an ability and willingness to abide by federal safety rules. As with any business expense, it can be internalized -- paid for by the company and, hopefully, covered by operating income. Or the costs can be externalized -- not spent by the company and instead, indirectly imposed on our Nation's highways and environment. The latter course of action is much more likely where extreme competition does not allow companies an opportunity to earn adequate profits to bear the costs of sound safety programs.

Not unexpectedly, a recent study, based on U.S. Department of Transportation accident data, demonstrates a direct correlation between carrier profitability and accident rates.[2/] The less profitable the company, the higher the incidence of accidents.

Recent research reveals that there is also a positive and significant link in a carrier's driver turnover rate and accident rate.[3/] The current high driver turnover rates in our industry

3/ Corsi and Fanara, "Effects of New Entrants on Motor Carrier Safety, Transportation Deregulation and Safety," -- Transportation Deregulation and Safety Conference, Northwestern University, June 22-25, 1987.

is adversely impacting safety. Furthermore, these transportation specialists confirm that there is a positive link between the age of equipment and accidents.

Data from roadside inspections corroborate the fact that many of the trucks now on our highways lack proper equipment and are inadequately maintained. The Office of Motor Carrier Safety indicates that 213,700 trucks were placed out of service in 1986 by federal and state inspectors due to serious safety defects. This figure represents 39.2 percent of the trucks inspected.

There is also evidence that financially strapped motor carriers will seek to cut costs by operating without the requisite liability insurance. Between 1985 and 1987, the ICC enjoined the operations of over 4,200 trucking companies which failed to maintain insurance coverage. This amounted to nearly ten percent of all ICC regulated carriers. The Department of Transportation estimates that as many as 25 percent of all carriers do not have adequate coverage.

There is no doubt that commercial truck accidents have risen since 1980. Accident statistics collected by the Federal Highway Administration indicate that interstate motor carriers experienced 31,389 accidents in 1980. By 1985, the number had risen to 39,273. Each year, between 4,000 and 5,000 persons die in truck accidents. The number of fatalities, injuries, and property damage all have increased. They have outpaced the increase in truck mileage. As a consequence of these accidents,

38-253 O—91——110

FHWA estimates society has incurred annual economic losses of over $3 billion.

In sum, administrative deregulation of interstate trucking has not improved productivity, efficiency, nor safety.

B. State Economic Regulation
Should Not Be Preempted

In most cases, state economic regulation of trucking predates federal regulation enacted in 1935. It serves to accomplish on the state level the objectives embodied in the Interstate Commerce Act and, indeed, in this bill. State economic regulation seeks to promote safe, productive transportation services at reasonable rates to all shippers and commodities. State regulation is not static; it is constantly reassessed and modified, if necessary, to meet the changing or special needs and demands of a state.

Forty-three (43) states currently regulate trucking in one form or another. Since 1980, five states have deregulated or substantially reduced economic regulation of trucking. Numerous other states have reevaluated and modified truck regulation according to their assessment of the public interest. In 1989 and the beginning of this year alone, the states of Alabama, California, Michigan, and Texas have considered legislative or administrative proposals to alter their regulatory programs. Last year, California, which is often the bellwether state, substantially relaxed general freight trucking regulation.

However, its revised program actually beefs-up the licensing requirement to promote safety; it retains rate filings for contract and common carriers to promote pricing information and deter discrimination, and also establishes a rate floor and rate cap to avoid unreasonable pricing.

Federal preemption would undermine California's revised regulatory program (as well as 42 others) which is the product of nearly two years of hearings that resulted in a carefully crafted program tailored to the needs of that state. This is inappropriate.

The states should have the right to retain the freedom to fashion regulations expressly suited to their own needs. A state's right to control activity within its borders is a fundamental right that should not be lightly discarded. Congress has considered such action in the past only upon clear and overwhelming evidence that the states, individually and collectively, have acted intransigently and burdened commerce. Such conditions are simply not present.

As noted above, the states are continually reviewing and modernizing their regulations to reflect public interest. One shoe does not fit all. Many states, particularly rural ones, believe that effective trucking regulation promotes the service and rate levels necessary for their business climate. Others value its safety benefits and labor stability. They need to, and should have, the right to choose the system to best fit their needs. The states recognize the need to adapt to changing times

and are the best qualified to administer to their own needs. Consumers and the electorate will tell them when change is necessary. Federal preemption is not appropriate in these circumstances.

LCV Operations in the Western USA

By Byron L. Geuy

In many advanced national economies since World War II truck transportation has become the preeminent mode of surface transport in terms of contribution to gross national product if not in ton miles transported. Because of its pervasiveness throughout the economy, truck transport is an obvious focal point to improve efficiency and productivity of freight movement. The pressure to make trucking more efficient is very apparent in those parts of North America where dependence upon truck transport is greatest. The limited rail network and absence of any extensive navigable waterway routes in Western North America underlie the emergence of improved truck transport technology in that region. Long distances between urban centers, low population densities, and natural resource-based economies are major factors encouraging the development of more efficient truck transport.

The purpose of this paper is to present a summary of the Western states' development of more productive trucks, their status in the late 1980s, and discussion of the factors influencing the acceptance and expansion of this transport technology in the United States.

WHAT ARE MORE PRODUCTIVE TRUCKS?

In the U.S. context more productive trucks are commonly referred to as "longer combination vehicles" (LCVs). The three most common LCV configurations in service in the U.S. are as follows:

The Rocky Mountain double which consists typically of a three axle tractor pulling a 48′ semitrailer and a 28′ full trailer. Overall lengths can range from 75′ to 98′. Gross weights can reach 110,000 lbs with seven axles.

The Turnpike double which consists of a three axle tractor pulling a 45′ or 48′ semitrailer and another trailer of equal or similar length. Overall lengths may range from 104′ to 118′ depending on trailer lengths and tractor wheelbase. Practical gross weights, when limited by the federal bridge Formula B, can reach 129,000 lbs with careful loading over nine axles.

The Triple combination which usually consists of a two axle tractor pulling a 28′ semitrailer and two 28′ trailers. Overall lengths again vary with tractor wheelbase and other minor hardware options from 98′ to 110′. A three axle tandem drive tractor is sometimes used, which adds about one meter to overall length. Gross weights under Formula B can reach 115,0000 lbs but typically are well under 100,000 lbs because this combination is favored by less-than-truckload (LTL) carriers whose average freight density frequently causes "cube-out" loading limitations.

More detailed typical dimensional and weight specifications for these configurations are shown in Figure 1. Two other less frequently seen LCV types operated in some of the Western states are: a truck pulling two trailers (with dimensions comparable to triples) and the LCV auto carrier consisting of truck with B-type hitch arrangements for the two following semitrailers. This configuration has an overall length in the 100′ range. Auto carriers offer the only relatively common example of a B-train hitching linkage operated in the U.S. at this time.

WHERE DO LCVs OPERATE IN NORTH AMERICA?

Of the 17 states from the Pacific Coast of the U.S. eastward to and including the six states of the Great Plains, 14 permit the operation of some type of LCV. Only Texas, New Mexico, and California along the southern tier of states prohibit their operation in this vast area. This generalization, however, is deceptive upon closer examination. Thirteen states permit Rocky Mountain doubles, 11 allow Turnpike doubles, and 11 permit Triples.

Other discontinuities in LCV operation are apparent upon examination of Table I. The discrepancies in permissible gross weights, access, and other operational restrictions assure much less than optimum transport efficiency. For example, LCVs in Colorado can load no heavier than tractor semitrailers. Triples in Nebraska must operate empty and Rocky Mountain doubles trailers are limited to 68′ including connecting device in Oregon and Washington.

In addition to the public highways mentioned, LCVs also operate in 1,560 miles of toll roads (turnpikes) in six middle Western and Eastern states as shown in Table I. All six states permitted LCV operations prior to any public highway operation in Western states. It should be noted

that turnpike administrators are motivated by business principles seeking to pay bond holders, maintain the capital facility, assure user safety, and encourage patronage from the dominant customer group, automobile drivers. After 25 to 30 years of continuous operation of LCVs on these turnpikes, it may be presumed their use of these facilities is economically and environmentally compatible.

BRIEF HISTORY OF LCV DEVELOPMENT

A number of factors combined with a cooperative industry/government process have shaped the present status of LCV use. Knowing the past is important in assessing the future of this transport technology.

The federal government's control of axle, tandem, and gross weight limits on the interstate system of highways effectively capped truck productivity at 73,280 lbs in 1956 and in 1974 at 80,000 lbs gross combination weight (GCW) for configurations in regular operation on all highways. One of several "grandfather" provisions in the federal law enabled states with statutory oversize/overweight special permit issuance authority in 1956 to continue to exercise that right.[1] Nearly all states in the Western region had authority in 1956 and it remains the basis for all LCV operations to this day. A few of the gaps on the maps represent states without the requisite grandfather authority. The future lies with corrective federal legislation. In summary, the interstate system is vital to an integrated LCV network. A special permit system is a legal necessity to operate an economically viable LCV network.

Western highway engineers with extensive road systems and comparatively low average daily travel from tax generating vehicles have emphasized low axle loads and stretched out equipment to avoid concentrated bridge loadings. Federal Formula B effectively reduces average axle loads as lengths and gross weight increase. This strategy conserves construction and maintenance funds. It dovetails with the Western truck operator's trailer (long or short) to either of the two common configurations in regular service. This approach provides a very cost effective way of gaining payload without obsoleting a major investment. However, the development of the necessary vehicle refinements and administrative control systems did not happen overnight. They have been the result of a 25-year evolutionary process beginning in the mid 1960s.

Figure 1. Typical dimensions of three common long combination vehicles.

That process can be capsuled into the following steps:

The trucking industry conducted research to develop hardware. Recently, government has sponsored limited research on componentry but not exclusively for LCVs.

Industry and state/province governments jointly conducted tests on performance, evaluated routes, and instituted operational test programs.

Established industry organizations developed regional objectives for LCV sizes and weights and guidelines for special permit rules and regulations.

Industry and government coordinated these same items through public sector organizations, such as legislatures, executive department agencies, and regional bodies of officials.[1]

The development of uniformity in the LCV arena is a voluntary activity to date without federal involvement except for two recent studies of the concept.[2,3]

There is an extensive technical bibliography documenting the multitude of tests, public and private, which have been conducted during the 25 years of LCV development. The Western Highway Institute (WHI)

Table 1 Status of Longer Combination Vehicle Operations in the United States and Canada

Jurisdiction	Longer Combinations: Rocky Mtn Dbls (RMD)	Turnpike Dbls (YD)	Triples (TR)	First Operation in	Maximum Length (Feet)	Maximum Gross Weight (lbs)	Highway Restrictions	Operational Restrictions

*Gross weight is achieved before cubic capacity is fully utilized; lower density freight would result in lower relative fuel consumption

alone has prepared eight major technical reports on horsepower, traction, offtracking, splash and spray, etc. [4–10] and in 1980 summed it all up in a 500 page report to the Transportation Research Education and Development Foundation.[11] Every contiguous Western state has conducted tests of LCVs, some two and three times. Nine states have produced 13 published reports on their research.[8, 12] In addition, an extensive body of literature exists on various components and performance characteristics of LCVs as investigated by equipment suppliers, consultants, universities, etc. The synthesis of this work in each state's rules and regulations and permit enforcement process represents the balancing of positive and negative performance and productivity characteristics which are unique to each configuration and, in some degree, to each jurisdiction's operating environment.

To facilitate the adoption of compatible, if not uniform, guidelines, WHI published a set of LCV model rules and regulations together with a set of 11 model administrative forms in the early 1970s. Most states used them initially, but gradually adjusted them to fit their experience, with the result that considerable nonuniformity now exists. In early 1987 WHI, together with Western state trucking associations and a committee of administrators cooperatively reviewed and revised the set of model rules.[13]

The revised rules continue to be stringent on such points as driver control, equipment specifications, speed, stability, operating procedures, insurance, and accident reporting.

MEASURES OF LCV PERFORMANCE

In the discussion that follows, the attempt is made to briefly characterize the performance of LCV operations in the Western U.S. according to a number of variables as reported by individual users, officials, and researchers to give some flavor of their contributions to the Western transport system. It is fundamental that each type of LCV performs differently and is selected by the operator for its particular blend of qualities. Similarly the state rules and regulations applicable to each type LCV typically vary to adjust for those critical performance differences as they affect public safety.

Productivity

Table II provides a handy reference chart of key performance variables by three LCV types compared with the two standard truck configurations in ordinary (nonpermit) operations. Columns 4, 11, and 12 particularly illustrate the absolute weight and cubic capacity of these units as well as their comparative performance by index number. The gross weight of 105,500 lbs in the table is the most common gross limit observed by five states. Seven others are more liberal with four allowing full Formula B giving a theoretical addition of 23,500 lbs at nine axles on Turnpike doubles. Formula B would permit 110,000 lbs on Rocky Mountain doubles.

Industrywide LCV productivity data are not available. However, anecdotal information from users' federal testimony is suggestive of the magnitude of savings obtainable. Western experience *if* projected nationally would yield a 25 percent reduction in one of the three largest carriers' fleets — a $43,000,000 saving. Another carrier in the top three projects a national savings of 20 percent of its miles, based on Western experience.[2] Edson Express reportedly uses Rocky Mountain doubles for 90 percent of its LTL operations because the consumption patterns of small towns favor a mix of truckload freight outbound and LTL inbound.[1] The joint industry questionnaire for the 1985 federal LCV network study revealed about 1200 permittee companies in only four Western states, indicating extensive regional use of LCVs.

The Utah Motor Transport Association reports an average departure schedule of over 600 LCVs leaving Salt Lake City daily. The President of Holly Sugar reported that LCVs were responsible for transport savings enabling two to three Western sugar refineries to stay in operation. Wyoming's two year test of increased

weight on the interstate system by over 450 permit operators showed nearly 75 percent used Rocky Mountain double equipment, while comprising less than two percent of the truck traffic on one interstate route and seven percent on another. The study nevertheless resulted in 26,000 fewer trips and a saving of 670,000 gallons of fuel. One bulk cement carrier reduced rates 14 percent as a result of LCV equipment in the test.[14]

The statement is frequently made by LCV advocates that in America's deregulated trucking industry (with average operating ratios in the high 90s), LCV savings are passed on to shippers in large measure and help forestall rate increases.

Fuel Savings

Montana tests over four months showed triples saved 27 percent on fuel consumption over twin trailers. Utah found the saving to be 25 percent and Wyoming 23 percent. Turnpike doubles saved 42 percent over tractor semis in a 17 month test by South Dakota. Individual carriers report comparable figures. Salt Creek Freightways (now Edson Express) reported an 8.6 percent fuel saving for RMDs compared to doubles over a 2.5 year period. Fuel is a significant cost factor to truck operators.[11]

Access

Access is related to productivity because if the point of freight origin or destination, or points for food, fuel, repair, and rest, cannot be reached without breaking up the LCV into shorter configurations, then additional costs are incurred. A number of considerations mitigate restricted access. Of primary importance is the permit system itself. Individual routes are approved in advance after an engineering evaluation of road geometrics, structure adequacy, and the condition of traffic operations along the requested route.

Offtracking data in Column 7 of Table II illustrates that triples are slightly better than the standard, generally unrestricted, tractor semitrailer in turning characteristics. Triples are heavily used in point to point terminal operations which tend to be located on the periphery of metropolitan areas. It is a fact that the newer cities of the West have experienced their area growth in the automobile age. Truck terminal locations are sought to minimize traffic congestion away from core cities and near major interstate or circumferential freeways. When growth overtakes these outlying locations, as occasionally happens, the appreciation in land values can often offset a terminal move to a more favorable location. Indeed, a number of "takeovers" in the post deregulation trucking industry have appeared to be driven more by the real estate asset value than the transport earning capacity.

The transport industry has not sought LCV access beyond the lower traffic density ring on the outer circumference of urban areas. At break bulk terminals, refueling stops, or marshalling yards, whether publicly or privately owned, the LCVs can easily be broken down for delivery to final destination in conventional configuration. The reverse process is equally easy in the makeup of outbound LCVs.

Rocky Mountain doubles and short Turnpike doubles as well as truck and two trailers are often the configurations of choice for relatively short hauls of mineral, petroleum, and agricultural resources in the West. As the recent Wyoming study[14] illustrated, these hauls frequently are crucial to the economic viability of the plant, mine, or refinery involved. These facilities are relatively remote and with low traffic volumes being the norm on service roads, do not pose major access problems to LCVs.

The 1986 Western states LCV study by the Federal Highway Administration surveyed 14 criteria used by states for selecting LCV routes.[3] The most commonly used criteria were: limited access; four or more lanes; divided highway; 12 foot lanes; minimum curvature; and grade. Lesser factors were: minimum shoulder width; level of service; accident rate; passing lanes; and interchange spacing. Idaho has developed a scoring system for rating all routes and then uses offtracking ability of the LCV as the final classifying factor for permit eligibility to three classes of route system.[1] States that have the longest experience with LCVs have the simplest review process.

The consensus of opinion asserts that the LCV safety record is better than that of trucks in general for many reasons. These are due to the special permit requirements under which they operate which assure generally higher standard highways, better drivers, better equipment, and above average weather conditions.

HIGHWAY AND BRIDGE EFFECTS

Permit engineers in evaluating routes for LCV operation consider many factors. The Triples exert 26 percent less axle weight effect measured in equivalent standard axle loads (ESAL) per ton hauled than doubles on flexible and rigid pavements at the 105,500 lb GCW loading. Turnpike doubles impact pavements at the same 105,500 lbs up to 62 percent less than the tractor semitrailer. The Rocky Mountain double has intermediate performance. The indices are shown in Column 8 of Table II. Even when loadings reach full Formula B as permitted in four Western states, the pavement effects rating of LCVs is better than conventional equipment per ton hauled in comparable service. When tandem drive tractors are used with triples and loaded as high as 119,000 lbs GCW the pavement effects rating is still slightly better than the tractor semitrailer per ton hauled on flexible pavements, and 33 percent better on rigid pavements.

A computer analysis of four bridge types representative of many structures on the interstate and primary highways in the West has been undertaken.[7] Each bridge had three different span lengths. Each analysis confirmed the superior performance of the Triples and Turnpike doubles when measured against the tractor semitrailer or the bridge design vehicle. The study concluded that the use of LCVs would extend bridge life and reduce maintenance costs.

These findings are not inconsistent with preliminary results reported by AASHTO from a comprehensive national bridge study by the University of Maryland. That study evaluated the impact of 11 vehicle configurations including the three common Western LCVs upon a national sample of over 300 bridges using 20 different combinations of standard bridge evaluation criteria. This study will also generate analytical software that will enable permit engineers to readily evaluate bridge capacity on proposed LCV routes as well as indicate cost effective strengthening measures in structures determined to be inadequate.[1]

MECHANICAL ISSUES

Much of the early research of LCVs had dealt with ways to assure satisfactory mechanical performance by LCVs and their major component subsystems. This work continues to "improve the breed" and many of the findings are reflected in the LCV model rules and regulations.[11] The following cursory visit to these performance measures can give only the briefest glimpse of the experience and research findings in each topic area:

Traction

There are 94 Interstate System highway grades in the Western states with grades of five percent or more and 12 grades over six percent. Packed snow conditions can create traction limiting situations for Formula B loaded triples unless pulled by 4x4 tractors under these conditions. Permit rules in the affected areas guard against this eventuality as does close coordination between highway patrol, maintenance, and dispatch personnel.[5] Eleven states have weather restrictions for LCVs in their rules.

Horsepower

Truck and engine manufacturers offer a range of engine and drive train components that assure acceptable acceleration and gradability on the most demanding Western LCV routes.[6] They also provide sophisticated specification analysis service to match hardware ability with operator requirements. Regulators have settled upon a simple-to-enforce speed on grade requirement to measure road performance.

Braking

The requirement that all axles of an LCV apply braking force almost simultaneously led to the development and subsequent requirement for fast air transmission and release valves. The need for proper brake balance and compatibility of brake linings and valving is shared with conventional trucks. LCVs have several advantages contributing to their superior braking performance. Formula B or lower gross loadings assure individual axle loads well within the brake capacity of each wheel. On wet surfaces the wiping action of multiple trailing tires progressively improves the surface friction coefficient for rearward axles. Multiple unit vehicles exhibit a marked tendency to resist unbalanced override braking forces causing tractor jackknife and/or trailer swing. Triples particularly benefit from the stabilizing effect of the rear units, a phenomenon especially noticeable on ice course testing.[11] LCVs easily meet all federal and state braking distance requirements.

Dynamic Stability

The principles determining the dynamic behavior of various truck configurations are much better understood today than when LCVs were first used. However, the stabilizing effects of lowering the center of gravity, lengthening wheel bases, forward placement of heavier units, wide axle tracks, no slack hitches, stiff tires and suspension, lubricated fifth wheels, and proper forward set of tractor fifth wheels have long been recognized. They are evident in the model rules and regulations for LCVs. Proper equipment assures the ability of trailing vehicles to track within three inches of the line of towing vehicle.

As a result of more research, most of it through computer simulation, a question has been raised as to the yaw instability in rapid lane change of the rear trailer in conventional doubles, and particularly triples, operations. This research has given impetus to regulatory initiatives in Canada to encourage the use of B-train combinations and to the development of a satisfactory double drawbar dolly.[11] Analysis of accident statistics in the U.S. have not as yet provided any conclusive proof of this alleged design deficiency as the cause of an inferior safety record. As will be noted, LCVs in all their forms own the best safety records in the U.S. trucking industry — for whatever reason.

Offtracking

Slow speed offtracking is well understood and the predictive models for this phenomenon are widely used in facility design by engineers and architects. As noted earlier, this characteristic, which varies considerably by configuration type as shown in Figure 1, is the basic determinant for differences in the route system permitted for Turnpike doubles and Rocky Mountain doubles.[6]

Backing

As a general rule, configurations with one or two points of articulation can be backed a reasonable distance. However, tests have shown A-dolly doubles (three pivot points) or triples (five pivot points) can be backed up sufficiently far to pull around an obstacle in the traffic lane.[11]

Splash and Spray

Suppression of vehicle splash and spray has proven to be a very complex problem. A great deal of industry and federal research effort has been applied to finding a solution. In the context of LCVs the studies have consistently shown lowest rankings for single drive axle doubles and triples in van configuration. These types respond well to the application of no-rebound synthetic grass type mudflaps and narrow side skirts. One state known for its high precipitation has required splash and spray "treatment" for LCV equipment.[5]

HUMAN FACTORS IN LCV OPERATION

Federal legislation in 1987 now being progressively implemented through rulemaking is tightening the standards for all truck driver licensing in every state. Ultimately, it will prevent multiple licenses and create a national accident record center. The model rules place great responsibility upon permit holders to have an aggressive safety program including a documented driver training and certification program conforming to

applicable laws. The driver must have documented special instruction and training in the LCV type he is to operate and be under the control of the permit holder.

It must be admitted, however, as the 1986 FHWA report[1] details, that the states have not been sufficiently forceful in adopting these provisions. Nevertheless, it can be surmised that the permits are quite valuable and that their revocation by the state would be so damaging that carriers have voluntarily done an adequate job thus far in assuring that only senior experienced drivers are assigned to LCV operations.[16] A number of state reports have made this observation and it is a logical causal factor in the current LCV safety record.

LCV SAFETY RECORD

The LCV highway accident experience is, of course, the ultimate measure of LCV safety capability. Unfortunately, state and national motor vehicle accident data provide very limited reliable accident rates by configuration type and exposure (miles of travel). Individual company data from many large fleets and from turnpike authorities show LCV accident rates well below those of conventional trucks.[11] The state of Nevada reported the 1986 rate for triples as 0.34 per million, that of doubles 0.90, the tractor semitrailers 2.1, and single trucks 2.77 and affirmed that it matches well with data from prior years.[17]

The University of Michigan Transportation Research Institute (UMTRI) with the best national base on medium and heavy truck fatal accidents, reported 18,119 tractors involved in fatal accidents over the five year period (1980-84). Three percent were bobtails, 91 percent were pulling one semitrailer, five percent were pulling doubles, and only four tractors were pulling triples.[18] Suggestive as these numbers are, skeptics insist on accident data controlled for exposure, and comparable operating conditions. A feasibility study for that kind of data acquisition and analysis effort is now underway at UMTRI sponsored by the Motor Vehicle Manufacturers Association (MVMA) and Western Highway Institute (WHI).

It is perhaps fair to say that the consensus of opinion asserts that the LCV safety record is better than that of trucks in general for many reasons. These are due to the special permit requirements under which they operate which assure generally higher standard highways, better drivers, better equipment, and above average weather conditions.

ENVIRONMENTAL FACTORS

In recent years federal legislation has established a timetable for reduction in truck noise levels. LCV power units will meet these requirements. As noted earlier, their areas of operation lie outside urban areas where the greatest concern for unnecessary noise is manifest. This is a fortuitous circumstance for the complete solution to the tire noise problem at speed has not been found and LCVs have many tires.

The problems of air quality in the nation's metropolitan areas are the subject of accelerated efforts at this time to meet mandated goals on a range of air contaminants. Although quantitatively small contributors to the air pollution burden in some of the more impacted areas like Los Angeles, Phoenix, and Denver, truck operators are being included in drastic strategies to effect improvements. Some of these would limit operating hours and require conversion to presumably cleaner fuels like methanol and liquid petroleum gas.[19] LCVs burn less fuel per ton of freight delivered and they do not penetrate the core areas of the metropolitan zones in question.

TAXES

Taxes and permit fees applicable to LCVs reflect the same diversity in systems and levels as apply to trucks in regular operation.[3] In general, the trucking industry supports a permit fee system adequate to administer an effective administrative and enforcement program to ensure compliance with individual state LCV regulations. This program should include the capability for reporting meaningful LCV safety statistics and occasional reports, based on sampling techniques, relating to the economic and productivity aspects of LCV operation.

Highway user fees applicable to LCVs should be an integral part of the state's user fee structure and be based upon acceptable cost allocation procedures for the individual LCV types, considering effects upon various cost elements and annual travel by highway system.

In addition, the industry has demonstrated a willingness to contribute to the cost of upgrading certain highway facilities in specific areas to accommodate permit holders, groups of users, or shippers. Many states have procedures to enable these joint funding arrangements for various highway and related facility expenditures.

JOBS AND LCVs

In general terms, organized labor in the trucking industry has actively opposed the spread of LCV operations although including premium pay in the national contract for LCV drivers. This position has been maintained despite the substantial decline in union truck driver membership since deregulation. The recently negotiated contract calls for approximately six percent annual increases over three years for an industry with composite operating figures barely avoiding red ink. LCVs offer one of the few productivity strategies to keep unionized carriers profitable and competitive. Further erosion in their numbers would seem to ensure a loss of jobs far more abundantly and certainly than the speculative decline that might occur over the short term from expanded LCV use. The problem is very similar to that faced by other industries in the U.S. seeking to install more efficient capital equipment to maintain or recover competitive position in the world market.

RAILROADS AND LCVs

Railroads, with minor exception, are privately owned in the U.S. but historically have had a sympathetic ear from government. They also have become fewer in number, larger, and more competitively aggressive since deregulation early in this decade. In most areas of the West, trucks provide the only alternative mode of shipment for dry freight. Rail prices in the absence of rail, pipeline, or water competition are based on truck rates adjusted for the value difference in quality of service provided. Clearly in these circumstances, which obtain widely in the West, the more ineffi-

cient trucks are, or the higher their operating taxes become, the higher can be the railroad rate structure for competitive traffic.

A case study in the verification of the above scenario was provided in April 1988 in the publication of Wyoming's report on its two year LCV test. LCV transport provided the economic efficiency needed to break Union Pacific's monopoly on mineral shipments out of southwest Wyoming. LCV hauls of this commodity to central Wyoming and northwest Utah put two more rail-truck competitors into the market resulting in rate reductions for shippers and customers.[14]

Many railroads have recently acquired new trucking subsidiaries but these newcomers' contribution to consolidated corporate earnings are far too small at this stage to generate any expectation of change in the historic rail/government affairs strategy toward its very numerous but much smaller truck competition.

A close look at some aspects of LCV potential gives good reason to question rail fears of substantial traffic diversion modeled by the 1985 federal study. Triples operators are essentially LTL carriers — a market the railroads abandoned decades ago. Turnpike doubles are likely to have a very limited route system for many years and the special leading constraints forced by Formula B inhibit long haul truckload utilization of this configuration as demonstrated in the MHTA four state tests.[15]

Finally, Rocky Mountain doubles and short Turnpike doubles have shown themselves to be best adapted for mixed freight service to Western communities and short resource development hauls which the rail network either cannot service or has effectively abandoned. In reality, the modes are far more complementary than competitive and should be in step with each other and support productive innovation in each industry in the interest of national transport efficiency.

What The Railroads Say. . .

It was widely publicized recently that the railroad industry is very concerned about the potential productivity gains made by the trucking industry in the states.

Thomas L. Finkbiner, Assistant Vice President of International and Intermodal Marketing for Norfolk Southern Corporation was quoted at the American Railroad Conference in Washington saying, that if the trucking industry is able to successfully lobby the state legislatures to allow twin 48-foot trailers in a majority of the states, then the future of intermodal movements by rail is in serious jeaopardy.

He acknowledged that today, motor carriers using "doubles," a 28-foot trailer combined with either another 28-foot or longer trailer achieves an operating cost of about 93 cents per mile. If twin 48-foot trailers became widely used, Mr. Finkbiner speculated that the operating cost would drop to about 54 cents per mile. He said, "We couldn't get within a Grand Canyon distance of that figure. If twin-48's are made legal, we might as well roll up our rails and go home because it's over."

Reauthorization of the Post-Interstate
Surface Transportation Programs

Testimony
by the

Carolinas Transportation Compact

before the

Subcommittee on Surface Transportation
Committee on Public Works and Transportation
United States House of Representatives

September 21, 1990

Durham, North Carolina

Peggy Upchurch
York County (S.C.) Council
Chair, Carolinas Transportation Compact
Urban Institute, UNC-Charlotte
Charlotte N.C. 28223
704-547- 2308

Testimony by the Carolinas Transportation Compact
before the
US Subcommittee on Surface Transportation
Durham, North Carolina
September 21, 1990

The Carolinas Transportation Compact, in cooperation with the Charlotte Chamber of Commerce, respectfully submits the following testimony to the Subcommittee for its consideration:

First, Congress should change the present funding formulas to redress their inequities. Federal funding formulas should return to the States and localities transportation funds in proportion to their contribution.

As Congress reconsiders the funding structure for transportation, it needs to redress the present imbalances between donor and donee States. States should receive from the Trust Fund and other programs, in total, approximately what they put into it. Congress should change the present "85 % minimum allocation" rule to a 100 % allocation rule.

Flexibility to expend these funds in ways that each State and region deems appropriate is essential. The present categorical funding constrains many States and localities, which are required to contribute thorough gasoline and other taxes, but cannot spend those funds that are returned in the most effective ways. States and local governments are in the best position to determine needs and set funding priorities.

Second, since transportation problems and solutions are rarely confined to just one county or one city, Congress should encourage communities to plan for transportation needs on a truly regional scale.

In many communities, transportation issues cut across present area and even State boundaries. In the Charlotte region, over 80,000 commuters each day come into the central county from surrounding counties. The present structure for metropolitan planning, while helpful, does not address transportation problems on a regional scale. Many cities and counties find themselves planning in vacuums, aware of the changes in surrounding counties but unable to conduct the regional planning needed to deal with them.

In a few areas, interest in regionalism here is not just talk, but has moved to the planning and action stage. In the Charlotte N.C. region, a rapidly growing mega-region stretching 75 miles across two States, elected officials have recognized the importance of regional thinking. Thirteen counties in the region have formed the

Carolinas Transportation Compact, a voluntary organization whose mission is to advocate and plan for the regional transportation needs of this area. Compact members include elected and appointed officials from each county, balanced between large and smaller counties. Funding comes from member contributions. The North Carolina Department of Transportation and the South Carolina Department of Highways and Public Transportation are actively involved in the Compact's work.

The Compact's activities cover all modes and span the entire region. In one major effort, the Compact is working with the State Departments of Transportation to conduct a feasibility study of a the **Carolinas Parkway**, a regional beltway that would circle Charlotte at about 20-30 miles out. Serving the surrounding towns and counties, the Parkway would provide for around-the-region access that will be needed in the next century, while diverting heavy through traffic out of the congested region center. The study will be a high-level first cut of the costs, benefits, and economic impacts of this proposal. Another study is focusing on the need for a **Regional Transportation Authority** that would plan and operate regional vanpool, bus and possibly rail services between Charlotte and the surrounding cities. NCDOT has pledged its assistance in organizing an authority, and the NC Legislative Study Commission on Public Transportation Financing is actively reviewing the issue. A third study is looking at **rail right-of-way preservation**, to ensure that transportation corridors will be there in the future when they are needed.

These positive steps reflect the Compact's belief that the region's future prosperity rests firmly on good transportation service to all areas. The Compact's goal is to progress that service cooperatively with other organizations. By working together, the region will be both stronger economically and ensure a better quality of life. Congress needs to act to ensure that regional transportation planning that balances economic growth with quality of life is encouraged, by supporting the activities of groups such as the Compact.

> **Third, Congress should move forward with intelligent-vehicle/highway systems (so called "Smart Car") technology, concentrating on medium sized applications.**

Growth in traffic and mobility will, by all accounts, substantially increase congestion in the years ahead. While certainly increases in capacity and improved transit systems will be needed, clearly we cannot "build our way out of congestion", and if we could, we don't have the money to do it. Smart-car technologies, that use the highway systems we now have more efficiently and safely, save fuel and air pollution, AND retain mobility, are an under-funded approach in the US, yet are being funded with $ 800+ million efforts in Europe and Japan.

These systems would appear to be particularly applicable to medium-sized areas throughout the nation, where congestion has not yet

overwhelmed the road system. Most citizens live in these cities, not in the huge areas of Los Angeles, San Francisco or New York where the present experiments are focused. In the Charlotte region a number of private and public sector organizations are developing a proposal that would implement a smart-vehicle system in the region. This is a modest proposal - less than $ 10 million over 5 years - but could easily save 10 times that amount in road construction. Congress needs to get the IVHS program moving forward as a money-saver in medium-sized cities. Through incentives and favorable funding ratios, States should be encouraged to experiment with these technologies as a complementary portion of their transportation programs.

On behalf of the Carolinas Transportation Compact, it has been an honor to submit these remarks.

Thank you.

Chairman Norman Mineta
Subcommittee on Surface Transportation
B736 Rayburn HOB
Washington, D.C. 20515

Dear Mr. Chairman:

Enclosed is a copy of a letter that I received from a constituent of mine regarding his discontent with the mandatory minority quotas in the Surface Transportation Act.

While I know you are extremely busy, I appreciate your review of his letter and I request that it be submitted into the official hearing record if further hearings are held regarding this issue.

With best wishes.

Sincerely,

Thomas S. Foley
Member of Congress

SPOKANE, WASHINGTON 99211
(509) 535-3069
FR-AN-KG@3060/

JUN 1 1990

May 29, 1990

Representative Neal Kirby
Legislative Office Building
Olympia, Washington 98504

Dear Representative Kirby:

We are a small non-minority sub-contractor from Spokane, Washington specializing in highway guardrail and signing. Again this A.M. we were told by a Prime Contractor that our low bid to their firm was not used because the minority quota in the Washington State Department of Transportation bid advertisement forced him to use a higher "minority" price.

This same unfairness has been the experience of our firm since the implementation of the Surface Transportation Act mandated quotas.

The quotas for all Federal, State and County projects always seem to cover the flagging and guardrail amounts leaving our non-minority firm with no chance at all.

So then our competitors are nearly all minority or women run businesses. Some were our competitors before the quotas appeared in the contracts. We welcome competition on an equal footing. What we do not understand is why these companies who have been in business for years - Peterson Brothers, Junlo Corporation etc. - competitor "minority" contractors here in Washington, go on and on enjoying this discriminatory advantage? When are they considered established? We notice these firms hiring from the same hiring halls we hire from and they have no requirements or commitments towards the minority constituant other than what our firm would have if we were awarded the work.

We like all conscientious Americans are for helping minorities but to uproot and set aside the competitive bidding system can not possibly be the American way.

Surely there is a better way to address the real need of the minority - the 30,000 in taxpayer money that (we were lower by that amount on one project alone) went to a minority firm could have hired a teacher to give 30 minority children a social, economic and cultural head start.

After eight (8) years of this wrong we still can not believe that the legislators and administrators of our country could not be informed enough to right this wrong. We have been told that to vote against anything "minority" is to commit "political suicide", that those on the receiving end would surely not give up their "freebies" without a bitter fight. Thus we know what all political people are up against - but somehow there must be a way.

We are merely asking that you become informed of what is really happening. Check with any Prime Contractor in this state - the story will be the same.

We have a very large file of correspondence which very well documents the discrimination that our firm has experienced. The file includes letters from contractors telling us they are sorry but can not use our prices even tho we are low - that they can not use us because we are not a certified minority, letters from legislators and administrators that know it is wrong but do not seem to be able to do anything about it and etc. It is available for your review anytime.

Please find the enclosed copy of page from Mountain States Legal Foundation, "Cases Under Review", the situation is like ours in other states - We ask My God when do the legislators of America abolish discrimination in legislation? Would you please reply?

Yours truly,

FRANK GURNEY INC.

MOUNTAIN STATES LEGAL FOUNDATION
1660 Lincoln Street
Suite 2300

Non Profit Organization
U.S. POSTAGE
PAID
Denver, CO
Permit No. 847

CASES UNDER REVIEW

■ The Davis-Bacon Act (requiring payment of "prevailing wage" on all federally-funded projects) was passed into law in 1931. Many scholars assert that it was originally adopted for a "discriminatory purpose," a violation of the Constitution. MSLF attorneys are investigating the possibility of an action on behalf of aggrieved businesses.

■ A Colorado Springs, Colorado, highway guardrail subcontractor estimates that he loses one-third of his annual gross revenues due to the "minority set-aside" program mandated by Congress. Although the ability of the U.S. Congress to engage in "reverse discrimination" has remained unchallenged since 1980, recent decisions by the Supreme Court indicate that such social engineering may be unconstitutional. MSLF has agreed to represent the highway subcontractor.

■ A Presidential Executive Order requires regulations for the so-called Combined Federal Campaign in which more than 3.1 million federal workers are solicited each year to contribute to needy causes such as the United Way. Under federal regulations only "health and welfare" organizations may participate. However, the U.S. Government approved the participation of 18 environmental organizations whose combined budget is $254 million a year. MSLF attorneys are investigating whether this decision violated the Executive Order and federal regulations.

■ Despite its presence on the endangered species list since 1967, the Cui-ui, a fish found in Pyramid Lake in northern Nevada, has not yet been "recovered." Attempts to "recover" an endangered species — that is, ensure its propagation so as to remove it from the endangered species list — are required by federal law. Many northern Nevada water users believe the U.S. Fish and Wildlife Service has failed to perform its duty thereby threatening their water supply and a nearby wildlife refuge. MSLF attorneys are investigating the possibility of an action against the FWS.

■ In Missouri and Colorado, farmers and ranchers have come under attack by the FWS, the EPA, and the Army Corps of Engineers for the landowners' attempts to protect their fee lands from inundation by nearby streams. U.S. Government demands for mitigation in the form of gifts of land to the U.S. Government and costly improvements have been buttressed with threats of fines and penalties amounting to $25,000 per day. MSLF attorneys are investigating the possibility of Government overreach and unconstitutional "takings."

COURT GRANTS REVIEW *from page 1*

groups, to become directly involved in policy making which the Constitution states is the responsibility of elected officials.

The Federal Land Policy and Management Act of 1976 required the BLM to adopt a program to eliminate unnecessary or outdated federal decisions limiting the use of federal lands. Thereafter, BLM took 814 separate actions removing outdated withdrawals and classifications, each of which was accompanied by environmental studies and opportunity for public comment.

Although the NWF declined to challenge any one of the 814 actions, in a lawsuit filed after BLM had completed action, it asserted that an Environmental Impact Statement (EIS) should have been prepared on the entire program. Therefore, it argued, the court should set the program aside.

For three years those lands — involving more than 1,000 oil and gas leases, more than 7,000 mining claims, as well as numerous other multiple use activities — were tied up by a federal court injunction. In November 1988, the district judge agreed with MSLF and the U.S. Department of Justice that the NWF had no legal standing to bring the lawsuit. That opinion was overturned in June of 1989, by the Court of Appeals for the District of Columbia. On April 16, the Supreme Court will review the Court of Appeals decision. Approximately 75% of reviewed cases are reversed.

TESTIMONY

provided to the

SURFACE TRANSPORTATION SUBCOMMITTEE

of the

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

by the

METROPOLITAN ATLANTA RAPID TRANSIT AUTHORITY
2424 Piedmont Road, N. E.
Atlanta, Georgia 30324-3324

regarding

SURFACE TRANSPORTATION REAUTHORIZATION

September, 1990

The Metropolitan Atlanta Rapid Transit Authority (MARTA) appreciates the opportunity to comment on the proposed reauthorization bill for federal mass transit funding. We believe that the industry has been served well under the Federal Mass Transportation Act (FMTA) of 1987 that currently defines the federal - local partnership and we would like to see that positive relationship continue.

In no small measure, the federal support that has been offered to MARTA has been a boon to the economic development of the Atlanta region and the State of Georgia. Our public transportation system has been instrumental in attracting to Atlanta the 1988 Democratic Convention, the 1994 Superbowl and now the 1996 Olympic Games. We gladly share our success with you and urge a continuation of this successful partnership.

HISTORY AND OVERVIEW OF THE SYSTEM

MARTA's entire history has been defined within the context of this federal - local partnership. From the very beginning, local commitment when combined with federal support has been the impetus for success.

Recognizing the importance of mass transit to the economic and social well being of their community, voters in the City of Atlanta, Fulton County and DeKalb County approved a comprehensive public transportation plan in 1971. As subsequently amended, the 1971 transportation plan calls for 60 miles of heavy rail lines, 45 stations and 33,000 parking spaces. The proposed network includes two main trunk lines that intersect in the Atlanta Central Business District (Five Points), four rail branches, one feeder rail line, and one busway (See Attachment #1).

Since 1971 MARTA has made numerous capital and service improvements involving the Bus System: new equipment, new maintenance and operating garages, passenger shelters, new bus routes, improved headways, extended operating hours, improved schedule information, etc. In addition, MARTA has been aggressively implementing the rapid rail transit plan.

The present operating system includes 1,500 route miles of bus service, 32 miles of rapid rail lines and 29 passenger stations. Average weekday ridership equals approximately 495,000 trips. Annually, MARTA provides 45.5 million vehicle miles of bus and rail service to the citizens of the Atlanta region. One hundred and fifty million passengers board the combined system annually and ridership increased by 3.5% during FY1990.

MARTA has been building the rail system in phases, giving priority to those phases which are given priority for reasons of construction staging or operating efficiencies. MARTA has in service 32 miles of track, 29 stations and 17,000 parking spaces. All of Phases A and B (see Attachment #1) are in service as well as all of Phase C except the extension from Chamblee to Doraville.

MARTA has under development at the present time twelve miles of track and six stations. This includes the last part of Phase C--two miles of track and the Doraville Station. This portion is 40% complete and is scheduled to open in December 1992.

The remainder of the MARTA System that is currently under development is Phase D which consists of ten miles of track and five stations. It includes three lines: 1) extension of the East Line from Avondale through Kensington to Indian Creek--three miles of track and two stations; 2) construction of a branch feeder line in the Proctor Creek Corridor--one mile of track and one station; and 3) the North Line from Lindbergh Station to the Medical Center--six miles of track and two stations. All of Phase D is under development--detail design, land acquisition as well as construction. Revenue service to Bankhead is scheduled to begin in mid-1992; to Kensington and Indian Creek in mid-1993; and to Buckhead and the Medical Center in mid-1995.

The total current estimated cost of Phase D is $449.9 million, of

which the Urban Mass Transportation Administration (UMTA) is providing $135 million or 34%. All federal funds are being applied to the East Line extension from Avondale to Indian Creek. The feeder line in the Proctor Creek corridor and the North Line to Medical Center are being built with local funds.

When Phase D is completed in the mid-90's, MARTA's rail operating system will consist of 44 miles of track and 35 stations. UMTA is providing $1.5 billion or 53% of the $2.9 billion cost. The local share is $1.4 billion or 47% of the cost.

REAUTHORIZATION CONCERNS

As the above history attests, MARTA has greatly benefited from the Federal - State partnership that has been defined by congressional authorization. A level playing field was established through the Surface Transportation Assistance Act of 1982 (STAA) which clearly defined the federal government's role in the area of public transit.

The STAA did two things to establish a level playing field: 1) provided that one cent of the federal motor fuel tax be dedicated to transit and thereby ended the vastly unequal competition for funds between transit and the highway interests; and 2) established that Section 3 discretionary funds be apportioned on

the 40-40-10-10 percentage basis. Forty percent going to meet the needs of the eight older cities for rail modernization, 40% to the 12 - 15 new start cities for capital construction, 10% to the bus systems for major bus improvements, and 10% for discretionary allocation to the other three categories.

This level playing field has worked well for MARTA and the Atlanta region's transit needs. While some minor adjustments in the impending reauthorization may prove necessary, major changes should be made sparingly. In considering these changes, MARTA has some further specific concerns that we would like to share with the Committee.

First, we support the continuation of the distribution concept (the 40-40-10-10 arrangement) among Rail Modernization, New Starts and Extensions, Bus and Bus Related Facilities and a "swing" category available to the other three categories.

MARTA supports the continuation of full funding contracts in the present reauthorization. It permits transit systems to have some assurances that projects begun in good faith will have the opportunity for timely completion over a span of years and appropriations processes. Full funding contracts have permitted systems using the mechanism to do better long-range planning and programming, allowing them to set up local matching resources on a scheduled basis.

There are those who would significantly alter the way federal funds are made available to local public transit systems, chiefly by providing that some state, local or regional agency be given the power to determine what projects (road or transit) may be built, and to determine the funding levels for such projects. This is generally referred to as flexible funding and MARTA has some concerns with the flexible funding concept. MARTA supports the current methodology for distributing federal capital grants. Our comment in this regard recalls the reasons for separating the mass transit account in the Highway Trust Fund from those funds available for roads and bridges; i.e., as a practical matter,in any dispute between highways and transit, highways would always prevail simply because of numbers, advocates and experience. The playing field between the two modes in any contest for funding from the same source is simply not level. We would strongly urge that the funding sources be kept separate for each mode. Competition is keen enough among rail, bus and rehabilitation without a return to the struggle of transit and highways seeking to raid each others share of the trust fund.

It is also recommended that the Committee consider retaining the concept of designated recipient. The designated recipient procedure has served the urbanized areas extremely well by reducing the bureaucratic maze through which government grants must go. We urge this so that systems with approved projects can receive

funding directly without layers of unnecessary administrative procedures causing funding delays.

Also, we need to express our concern over the imposition of federal mandates on public transit without a corresponding federal commitment to help meet those increased costs that will have to be borne by our public ridership. We will need assistance within the new reauthorization to meet the increased costs of the Americans with Disabilities Act (ADA) and the Clean Air Act now in conference committee. MARTA applauds the sentiments and goals behind the passage of the ADA and the Clean Air Act. We offer a long history of commitment to our elderly and handicapped population and we promote the environment. However, without additional federal assistance, the cost of these programs will most likely be passed to the fare box and result in decreased ridership - a counterproductive effect.

Finally, our thoughts on both funding levels and mechanisms reflect our experience with STAA over the years. We urge the Committee to retain federal operating assistance for all transit systems of all sizes. We applaud actions taken in recent years to resist the elimination of such assistance. We think the Committee might reconsider the cap placed on operating assistance in the STAA which limited operating assistance to 80% of 1982 levels.

As to obligation ceilings for the Mass Transit Account of the

Highway Trust Fund, we urge that the obligation ceilings reflect realistic expectations from the one cent motor fuel tax over the life of the reauthorization. As to the substantial surplus in the account which was accumulated above the authorized ceilings, we suggest a graduated spend-down of surpluses in the Mass Transit Account over the life of the reauthorization legislation in order to remedy damage done to both the infrastructure and operations of the transit industry over recent years of declining federal funding.

We want to thank the Committee for the opportunity to submit our concerns and thoughts on the reauthorization for your consideration. We look forward to additional conversations in this area as the reauthorization procedure moves forward. This is a time of great challenge and great opportunity for public transit and a positive working partnership will continue to benefit all of our citizens.
